“Art is what makes me live.”
— 93-year old visual artist

Preface

This study of aging visual artists in New York City offers a unique look at a population that has implications for us all. The stereotypes of aging, which I have both defined and battled all my professional life, are compounded for artists for whom stereotypes abound.

Not only does this study combat the misperceptions of aging, it sheds new light by the unique solutions artists embrace in living—for retirement (they don’t), for social networking, for communication (over three-quarters communicate weekly or daily with other artists), and as productive members of society, working in their studios on a daily basis. It deals with older people’s sense of mastery from a variety of New York communities in this city of immigrants. It shows them as productive, self-aware and savvy. And it provides some new ways of thinking about all of us as we age.

While this is not a medical or psychiatric treatise, through in-depth interviews and a methodology to identify hidden populations, it gets to the beating hearts of a population that lives as well as works creatively, a population that offers some new models to the growing freelance population, the baby boomers and the rest of us who would grow old.

Dr. Robert N. Butler, President and CEO
International Longevity Center—USA
August 2007
The purpose of Information on Artists III: Special Focus New York City Aging Artists (IOAIII Aging) is to understand how artists—who often reach artistic maturity and increased artistic satisfaction as they age—are supported and integrated within their communities and how their network structures change over time. Past evidence shows that as people age, they often become more isolated from each other, making it difficult for organizations to serve them both individually and as a group. While artists have a long history of self-sustaining mechanisms sometimes outside the mainstream system, the aging process poses particular challenges that artists themselves may no longer be able to meet. At a time when many artists are maturing in their art, such needs range from adequate healthcare and retirement savings to realizing the outcome of one’s career expectations and finding a community of colleagues and a stimulating environment where creative work can be nurtured. This study by the Research Center for Arts and Culture (RCAC) at Columbia University’s Teachers College, provides the first needs assessment of aging artists in the New York Metro Area.

- Projections estimate that by 2030, the older population will more than double to about 71.5 million, representing nearly 20% of the U.S. population.\(^1\)

- In New York City’s five boroughs, the over-65 elderly population (937,900 in 2000) is projected to grow to 1,352,000 by 2030 with the bulk of the increase after 2020. While the population is expected to increase 13.9% between 2000 and 2030, the increase in the elderly population is expected to be 44.2%!\(^2\)

- New York ranks third among states in the number of older people and is one of the few states where patterns of immigration and minority status will help shape the state’s future profile. This is also true in New York City.

In 2000, 35.9% of New Yorkers were foreign-born (2,871,032) compared to 11.1% of the total U.S. population; over 70% entered New York in 1980 or later. Thirty-two percent are from Latin America, and 23.9% from Asia; 32.5% of foreign born live in Brooklyn (931,800) and another 35.8% live in Queens (over 1 million). Immigrants and their U.S.-born offspring account for approximately 55% of the city’s population.\(^3\)

Psychological models of “successful aging” have highlighted evidence of positive personal growth, creativity, self-efficacy, autonomy, independence,

---

effective coping strategies, sense of purpose, self-acceptance and self-worth. Artists, as our study makes abundantly clear, are engaged in all of these indicators, especially with their art as a barometer.

“Art is the only thing that’s left in the world.”
—Homeless mixed media artist, age 72

We interviewed 213 artists born between 1910 (97 years old) and 1944 (62 years old) in 2006–2007 in four of the five boroughs of New York in English, Chinese and Spanish. 146 of these were professional artists. It is the results from these respondents that are reported here. (Please see the full report for some comparisons between professional and non-professional artists.) Their place in time gives each a very different history. The younger artists (closer to age 62) reached adolescence in the turbulent 1960s; the older artists reached adulthood in the Great Depression. It is the sweep of history that impressed us, as well as each artist’s individual experiences.

Freelancers

Ongoing research shows that people with “robust” networks tend to stay out of nursing homes and that people with diverse networks gain benefits to their quality of life. Our feasibility study indicated that artists are among those with robust networks. In addition, the irregular nature of the artist’s career trajectory—multiple and sometimes discontinuous jobs, day jobs and art jobs, movement in and out of paid employment, and the documentation of major career turning points give us important evidence to apply to the growing population of freelancers in the U.S. It is estimated that there are 10 million self-employed workers in the U.S. According to Creative New York, 53.8% of artists and related workers in New York City are self-employed.

What is an Aging Artist and Why New York?

The term “aging artist” includes but is not limited to, a person who has spent the majority of his/her lifetime working in one or more art forms and who considers himself/herself an artist. Gerontologists have separated older people into the “young-old” from age 65-74, generally considered highly functional and well, the “old-old” 75-84 and the “oldest old” over 85. In this study, the term aging refers to a person who is age 62 or over (62 is the official eligibility age for Social Security), clearly a chronological demarcation. In addition to the impact of physical aging of artists, “artistic aging”, e.g. artists’ perceptions of the artistic maturity of their careers, was also explored as artists described how the aging process affected their creative process.

Artist Definitions

Definitions in artist studies are always problematic. While there has been substantial progress in the community of “Creative Aging”—people who turn to art as they age for a myriad of reasons—our contribution can be felt most by its focus on professional artists. Since there is no official vetting body in the U.S. and no employment system that proves professionalism, there are 2 main ways we determined this status:

1. Respondent-Driven Sampling: This method identifies hidden populations and their social networks by using a series of coupon referrals. At the end of each interview the artist was asked to give four coupons to

---

5 While some general comments apply to professional artists in all the boroughs, we were unable to interview artists who reside in Staten Island and hope to do so in the future.
peers who were 1) 62 years old or over, 2) a resident in one of the five boroughs of NYC and 3) a professional visual artist. (See Appendix A.)

2. The in-person interview included opportunities for artists to self-declare as professionals, given 7 choices:

A1) I consider myself an artist.
A2) The main body of my activity is some form of art.
A3) I have a demonstrated record of exhibition, performances, installations, publications or other evidence of my art.
A4) My main priority is to make art.
A5) I spend the majority of my time making art.
A6) I have been formally trained/educated as an artist.
A7) I make a living as an artist.

These categories resulted from focus groups held at the beginning of the project. Of 213 recorded interviews, 146 respondents selected at least 2 of the above categories, the most frequent being the first 2 categories, self-definition and that the main body of activity is some form of art.

Of 146 professional artists, the mean and median age is 73 (72.7): 73.3% of all respondents were White; 12.3% Asian; 9.6% Black; 4.1% Hispanic. 23.5% are single; 40.9% married; 21.2% divorced and 12.1% widowed. The remaining 2.3% are separated or in a domestic partnership; 39.7% are male; 60.3% are female.

Generationally, 43.5% are first generation, 27.5% are second generation and 19.6% are third generation respondents. Over 98% are U.S. citizens.

FINDINGS
Profile of a NYC aging visual artist:

- 73 year old who is highly educated—has a Bachelor’s and probably a Master’s Degree
- May have studied at the Art Students League or Cooper Union
- Has a median income of $30,000
- Has health insurance
- Has a retirement plan other than Social Security
- Will never retire from art
- Ranks high in Life Satisfaction Scales
- Has high self-esteem as a person AND as an artist
- Feels validated as an artist
- Communicates daily or weekly with other artists
- Is satisfied or very satisfied with career
- Has been discriminated against because of age, gender and sometimes due to artistic discipline
- Goes to studio every day even if it takes 1.5 hrs to walk 2 blocks
- May have changed art medium due to physical or other restrictions, but never considered giving up being an artist
- Has sold work in the last year
- Has made no preparation for work after death
- Is not planning to leave New York City
We list some of our findings below as well as some implications in both the aging and arts communities for policymakers, funders, government and service agencies and artists themselves.¹⁰

1. Retirement: Over 60% of artists have a retirement plan other than Social Security. The majority of professional artists are not retired from their art work. Professional artists reported they will never retire from their art.

Studies on retirement timing and patterns give “increasing attention to work after retirement, partial retirement and bridge jobs between the end of a career job and the full exit out of the labor force.”¹¹ The concepts of a “self-defined retirement” when workers may actually be retired from one job but working at their art and work later in life that involves movement into new forms of work, whether art-related or not, are areas germane to aging artists. Retirement, as described by the National Council on Aging (NCOA) as a “process” rather than an “event,”¹² is changing radically. While 58% of the NCOA study respondents (65 and older) were completely retired in 2002, 23% described themselves as both “retired and working” and another 19% as not retired.¹³ One scholar using the Health and Retirement Study data shows that half of retirees follow a non-traditional retirement path that involves partial retirement or unretirement; 24% of retirees later unretire, among them, the more educated.¹⁴

Compared to the general population as of 2003, 70.3% of all older workers (55+) had some type of retirement plan coverage in 1998.¹⁵ In our findings, 60.1%, and more female than male artists 62+ (66.3% versus 50.9%) have such plans other than Social Security.¹⁶

“For me to retire from painting would be to retire from life.”
—Robert Motherwell, age 71¹⁷

2. Satisfaction: Aging professional artists rank high in life satisfaction scales and are very invested in their careers, although they may not refer to them as “careers.” Sixty-three percent feel validated or very validated as artists. Fifty-six percent think they have already made the best work of their lives.

Research speculates that workers who have frequently moved in and out of jobs, employment, or the work force may be less invested in their careers and less attached to the workforce.¹⁸ Wilensky defined careers as “a succession of related jobs, arranged in a hierarchy of prestige, through which persons move in an ordered (more or less predictable) sequence.”¹⁹ He and other sociologists reinforce the linkages between jobs and careers. Other analysts believe there is no such linkage. Still, others posit that certain careers involve no movement through a hierarchy of power or control.²⁰ Crane and Faulkner discuss movement within the confines of a social network and Becker...
and others have formulated that career success must be defined in terms of a subculture’s criteria. Our efforts in this study combine many of these points of view—movement within a social network (certainly the contemporary visual arts world provides one such network), and criteria of a subculture, in this case aging visual artists in New York City’s boroughs.

3. Social Networks: The average personal network size for aging visual artists is 29. This is a strong indicator of social capital, a theory based on the idea that social contacts affect the productivity of individuals or groups.

Gurung, Taylor and Seeman posited that “Gender is one of the most robust predictors of social support. Women receive and give more support over the life course and women experience greater benefits from social network interactions.” They add, “People are motivated to maintain their social network sizes as they age, although there may be changes in the composition of the networks.”

Interesting as the number in people’s social networks is the homophily or tendency of people to associate and bond with others like themselves. Homophily is much higher for women (49.1%) than men (34.4%), very high among Whites (54.6%) and somewhat high among black artists (38.9%). If non-professionals are included homophily soars to 72.7% for Whites, 54.9% for Blacks and 78.5% for Asians.

4. Communication: Older artists’ strong relationships with other artists (77% communicate daily or weekly) trump their communication with partners, family and children.

5. Income and Employment: It is unclear whether aging visual artists are doing better or worse than the general aging population.

Income from art, however, is a small percentage of the median income for both men and women. Nevertheless, 85% sell their artwork and make some money from their art.

While some aging artists have substantial assets and pension income, median individual income is $30,000 compared to $20,201 for men and $15,647 for women in the U.S. Census (for those 65+) and $37,000 in the Occupational Prestige Studies for those 62+. In addition, Social Security (average $4,820 annually) does not contribute substantially to income, undoubtedly because artists, like other freelancers, often do not work at full-time employment which pays such benefits. Income from art represents about 6% of artists’ median individual income. Unlike the stresses observed in younger artists, aging artists are not so much balancing jobs with making art; they are balancing the clock with making art. And while artists may have convertible assets, their day-to-day cash flow needs may still pose difficulties.

6. Discrimination/Ageism: Our data reflect a variety of kinds of discrimination against visual artists, 43% because of age, 42% due to gender, 28% based on artistic discipline, 21% based on race and 23% based on ethnicity. It is interesting that nearly 1/4 of artists feel discriminated against due to their artistic discipline in addition to the more obvious kinds of social bias.

In 1975, Dr. Robert N. Butler, Pulitzer-Prize winning author for Why Survive? Being Old in America, coined the term ageism which he defines as discrimination in areas including healthcare, the workplace, elder abuse, nursing homes, emergency services, the workplace, the media, and marketing. It is interesting that 60.8% of the women said they felt discriminated against because of their gender (and 0% of the men!) and 52.1% of women and 27.5% of men felt discriminated against due to their age.

21 Ibid, 48.
23 Ibid., 491.
24 Please see the full report for a chapter on Respondent-Driven Sampling, homophily and more comparisons between professionals and non-professionals.
25 The Occupational Prestige Studies comparisons are for men and women age 60 and over from multiple years of the General Social Survey data, 1972-1998.
7. Self-esteem: While self-esteem declines with age, over 83% of aging visual artists rated their self-esteem and their self-esteem as artists as good to excellent. They have more positive emotions than negative ones in relation to their work and to being an artist. Over 1/4 of aging visual artists want to reach a higher level of artistic expression/achievement as one of 3 top goals for the next 5 years, followed by increasing sales and number of works.

8. Education: Aging artists are more highly educated than the general public. Many, born before the explosion in arts-specific higher education, display the same education levels of much younger artists, much higher than the general population. According to both RCAC and other independent studies of artists over the last two decades, over 40% of artists have a Bachelor’s degree and another third have graduate degrees. In the current study, 28.4% have a Bachelor’s degree, an additional 29.1% have a Master’s degree and 2.1% have a Doctoral degree. This is a fairly remarkable finding considering that the BFA/MFA machine did not really begin until after World War II and only the youngest of our aging artists would have benefited from it.

Education was also recorded in less formal ways: 40.6% have experience as a mentor or master artist and 32.3% are also self-taught. Four percent worked as artists in the WPA.

9. Careers, Identity and Professionalism: While aging artists meet standard criteria of professionalism used by economists to a certain extent (time spent on art work, income earned, formal education), the generations being studied did not come to maturity in the career-focused society we live in now. Their professional definitions are both broader and deeper than economists’ and their views are decidedly different. In addition to time, training and commitment, evidence of production in the marketplace also helps to define professionalism: almost three-quarters of aging artists have evidence of their art—exhibitions, documentation, reviews. Collector support is another indication of professional status: 67.4% have had collector support.

10. Health Insurance: Like almost all previous RCAC studies over the last two decades, aging artists resemble other artists (but not jazz musicians): 93% have health insurance. In 2005 an estimated 46.6 million people were without any kind of health insurance coverage, but only 1.3% were 65 and older. Most of the population was covered by private insurance (67.7%), but 13.7% received coverage through Medicare; 13% through Medicaid and 3.8% through military health care. In 2003 the average health care costs for Medicare enrollees age 65 and over were $12,510. For those 85 and over, these rose to $19,658. In 2003, the poor or near-poor 65 and older spent 27.8% of their household income on out-of-pocket health care expenses. In the University of Michigan study over half the respondents spent less than $200 in annual out-of-pocket healthcare costs. It also shows that out-of-pocket health expenditures are lower for people in their 70s and 80s than for those in their 50s since older people are covered by Medicare and some of the people in their 50s are not covered at all. However, it is well known that Medicare (and Social Security) may not last in the U.S.

One way to interpret these findings is that, if you don’t have health insurance figured out by the time you are 62, you are probably dead. This does

---

27 Ibid, 49.
28 Ibid.
not mean artists don’t need help obtaining health insurance. They, and all freelancers, have a difficult time obtaining benefits before they are eligible for Medicare, if they lose their coverage, and if they have pre-existing medical conditions. And the cost is often exorbitant.

11. Legacy Planning: 61% of aging visual artists have made no preparations for their artwork after their death.

Only 10% have made plans to donate their work to an institution and 17.1% will leave work to their heirs. Twenty-seven percent need legal help bequeathing their work and planning their estates. Over 1/3 need financial help in archiving their work; 40.6% said they cannot transport their own work to exhibitions, different spaces, etc. and 94.1% have no studio assistants.

Twenty-one percent have no documentation at all for their work. For artists, some of whom say they “want to go down in art history,” the lack of documentation will surely prevent this. One black painter keeps a log of works he has sold on a doodle pad marked with crayons.

IMPLICATIONS AND RECOMMENDATIONS

REDEFINITIONS

1. Redefine both “work” and “old age.”

As it stands, the workplace is changing radically, with 10 million self-employed workers in the United States (and in NYC, over half of artists and related workers). The workplace is changing and with major changes in the increasing number and presence of women in the workplace and the nature of work itself (the ubiquitousness of technology, concepts of flextime, early retirement, etc.), both work and the workplace are undergoing examination. For aging visual artists and many others, “work” does not stop in the studio; it is an ongoing process, misunderstood by a society hungry for numerical measures and finished products. More flexible employment for older individuals provides choice, control and independence, possible reductions in welfare spending and increased income tax revenue, more experienced workers and a kind of “social inclusion” in the marketplace—all this in addition to harnessing the talents of an aging workforce.

SOCIAL CARE

2. Create support for informal social care using the networks provided by artists to each other as a model. By nurturing the strong community networks of artists and other groups, community-based health programs and strengthened social networks may prevent premature institutionalization.

Since aging artists communicate very frequently with each other, although most are not in communal living situations, agencies involved in the social care and support networks of the aging might look to them to better understand their social networks. Indeed, in some areas like race artists have created somewhat isolated enclaves, and with some immigrant populations a lack of skills in English increases this isolation. Yet they communicate frequently within their own networks and many are loathe to seek assistance outside those networks, reserving the energy they have for their art work. Social and arts service agencies can use this group to develop strategies of communication in order to serve them.

RETIREMENT

3. Investigate more flexible models of retirement benefits that allow for multiple jobs and careers, freelance work, productivity outside the normal 9-to-5 workday and mechanisms for retirement savings earlier in life.

 Retirement plans (pensions) only gained currency in the U.S. in 1935, later than many other countries, some with more advanced systems of social benefits.

The mandatory retirement age changed from 65 to 70 to being eliminated, but the ambivalence about aging and about how our society takes care of its growing and increasingly elderly population continues. The non-traditional careers of artists (and other freelancers) begs for a new understanding of both retirement and the benefits that situation confers. This may require modification of national and state laws to provide benefits for non-traditional employees.

LIVING SPACE

4. Adapt the administration of rent laws to allow seniors on fixed low incomes to remain in their rent-controlled and rent-regulated apartments and provide similar rent regulations for younger artists renting in New York City.

Forty-four percent of aging visual artists live in rent controlled apartments or residences and 58.8% stay in New York City because of affordable living space; 78.7% because of the cultural activity.

ESTATE TAXATION

5. Artists, by virtue of leaving their (usually) tangible work, have a particular interest in being included in discussions about estate taxation.

Some have found ingenious solutions; others face the general dilemma of not knowing if their heirs will honor their wishes or, if no instructions are given, will honor the work itself. These situations might benefit those leaving other kinds of property.

SOCIAL SERVICES DELIVERY

6. Among the difficulties in delivering appropriate social services to older Americans are a lack of awareness of potential aid, lack of accessibility and outreach, inflexible regulations and the decentralization of services.

After conducting town meetings with local communities about aging topics and the use of the coupon referral method, there is significant evidence of the substantial networks older artists have with each other. These networks might provide a basis for service delivery which reaches deeper into the community, thus increasing the impact of such services.

LEGACY

7. The creative contribution of older artists to the human community and to our understanding of art is important. What society does with aging artists’ contributions will reflect on our culture and the values we place on aging and art.

ARTIST-SPECIFIC RECOMMENDATIONS

1. Reinvent the community of artists.

Artists gave us some interesting practical ideas to recreate a more communicative and integrated community:

a) Create artists’ studios on Governor’s Island, where visitors would walk through the artists’ studios to get to cafes, restaurants, bookstores, etc.
b) Create a new type of foundation offering storage space to artists.
c) Make provisions for artists’ studios which remain in gentrified areas.
d) Recycle city buildings that artists would fix up and live in (the way SoHo began).
e) Designate dedicated areas in new condo/coop/apartment housing for a gallery run by artists.
f) Provide access to workspace for established aging artists to make their work.
g) Create more opportunities for artists to communicate with each other.

2. Create work/studio and exhibition space in government buildings.

Some artists suggested a variation on the city’s Percent-for-art program where aging artists’ work is featured.

3. Provide services for immigrant artists.

These include translation services to promote their work, and access to critics and scholars writing on contemporary art.

4. Appropriate more government and other grant funds for aging artists and provide access to existing grant funds.

—79-year old female artist

Many artists feel that they are being passed over for younger artists or simply not encouraged in the competition for funds and therefore few apply. This might also mean some assistance needs to be provided for grant writing skills and application materials.

5. Increase the access of social and artists’ services to reach the aging artist community.

Translate or broaden successful existing artist services specifically to aging artists such as Creative Capital’s career management seminars and ArtHome’s Creative Money Workshops.

6. Transport work and archive materials.

Many aging artists are incapable, both physically and monetarily, of transporting their work to shows, competitions and storage facilities. Resources should be provided to help artists archive their work (as one foundation is doing for a few artists) and create a “legacy plan.” Studio assistants, volunteers, students and services from non-profit organizations could be helpful here.

7. Integrate information about professional aging artists and the issues faced through a lifetime engaged in art into artist education.

With societal attention on youth and celebrity, aging artists’ lessons of a lifelong commitment to problem-finding and managing a professional career should be included in the professional education of artists.

“After you dissect artists, make sure you put them back together.”
—Well-known Black male painter, age 75, who died during the study
CHAPTER I

Introduction

For many artists well into their senior years, art is as visceral as breathing and as inevitable. As we age, we all face the challenge of engagement, which affects health, status, relationships, cognition. Those creative forces that live in a realm that incorporates pain, adversity, discrimination and despair as well as joy and exultation make the artist the person to whom society should look. In an age starved for inspiration, artists provide a signal path for the future. As the recent study of gerontology shows, attention to aging has become “the study of the possible.”

The purpose of Information on Artists III: Special Focus New York City Aging Artists (IOA III Aging) is to understand how artists—who often reach artistic maturity and artistic satisfaction as they age—are supported and integrated within their communities, and how their network structures change over time. In order to understand the needs and circumstances of artists as they age in a more comprehensive way a variety of categories were used to generate areas of inquiry into the lives of aging artists that have never been documented. Social status indicators were used such as artist income, financial assets, home and car ownership, level of education and income from art. Self-awareness and well-being indicators included life and career satisfaction, self-esteem and life satisfaction; communication with partners/children/grandchildren/neighbors, etc; quality of life; anxiety about growing older; and difficulty meeting basic needs (electric and gas bills, rent or mortgage, needed to see doctor but didn’t). The frequency, type, manifestation and impact of discrimination on artists were documented by a number of factors including age, artistic medium, gender, language, race and ethnicity. Artists’ political and community involvement—voting, registration in a political party, volunteering, donating work—were investigated to paint an expansive portrait of the diversity of aging artists.

Past evidence shows that as people age, they often become more isolated from each other, making it difficult for organizations to serve them both individually and as a group. While artists have a long history of self-sustaining mechanisms sometimes outside the mainstream system, aging poses particular challenges which artists themselves may no longer be able to meet. Such needs range from health care and retirement savings to the loss of a community of colleagues, unrealized career expectations, and a stimulating environment where creative work can be nurtured at a time when many artists are maturing in their art.

This study, by the Research Center for Arts and Culture (RCAC) at Columbia University’s Teachers College provides the first needs assessment of aging artists in New York City.

Our contention is that artists, who have learned how to adapt their whole lives, have a great deal to offer as a model for society, especially as the workforce changes to accommodate multiple careers and as baby boomers enter the retirement generation.

---

Interviewer: “How are you doing today?”

97-year old Visual Artist: “Well, I’m above ground.”

...IOA III Aging Study

---

34 In our recent study of jazz musicians, for example, musicians seemed very satisfied with their musical work, although not with their career situations.
Context

The artists we interviewed were born between 1910 (97 years old) and 1944 (62 years old) in 2006–2007 and their place in time gives each a very different history. The younger artists (closer to age 62) reached adolescence in the turbulent 1960s; the older artists reached adulthood in the Great Depression. It is the sweep of history that impressed us, as well as the individual experiences.

For those older artists born in or near the start of the last century, the United States soon entered World War I, and witnessed several health epidemics, the trial of Sacco and Vanzetti and the “Red Scare” of 1919-1920. With the 1920s came the Model T Ford and modernization: motion pictures, the long distance telephone, airplane travel and the growth of the suburbs. The 1929 stock market crash tipped the country into the Great Depression and the election of Franklin Delano Roosevelt as President in 1932. Soon after, FDR initiated a welfare relief program called the Works Progress Administration (WPA) and the art world was never the same. A 94-year old painter we interviewed in our feasibility study claimed that when he began painting he knew “what art was and who artists were” (many came from rich families and working-class artists were unknown) but the WPA made working class artists possible. The GI Bill that supported artists like Al Held allowed them to study for free, sometimes in Europe and artists became part of the working middle class.

In the 1940s McCarthyism took hold and many artists were brought before the House Un-American Activities Committee (HUAC) to identify other artists who had “Communist leanings.” People lost employment and careers and some went to prison over charges that were later deemed illegal or unconstitutional, but the damage had already been done.

Our youngest interviewees were born in the midst of this, at the end of World War II with another War (the one in Vietnam) etched in their consciousness. As college educations became the norm and BFA and MFA degrees were offered by multiple universities, those born close to 1944 experienced adolescence in a context of civil rights, women’s rights, human rights, the sexual revolution and a revolution in values. These artists also experienced the first federal institution for public funding since the WPA—the National Endowment for the Arts (NEA) and, in the next four decades, a system of grants and subsidy would develop through federal, state and local government agencies that included money for individual artists.

The 1970s, something of a respite from the previous decade, plunged the country into a very difficult economy, first a recession and then inflation. At the same time in New York City, SoHo was gentrifying. The neighborhood “officially bounded by Houston Street, West Broadway, Canal Street and Crosby Street...rose to fame as a neighborhood for artists during the 1960s and 1970s, when the cheap spaces vacated by departing factories were converted by artists into lofts and studios. SoHo’s lofts were especially appealing to artists because they could use the wide spaces and tall ceilings that factories and warehouses required to create and store their work. During this period, which lasted into the 1980s, living in SoHo was often of dubious legality, as the area was zoned for light industrial and commercial uses rather than residential, and many residents had to convert their apartments into livable spaces on their own, with little money.”

This fact is salient for our artists, some of whom were able to leverage ownership of these spaces only to find themselves real-estate rich and cash poor when we interviewed them.

In the 1980s, as SoHo gentrified (due mainly to the artists’ efforts), some artists left both the neighborhood and New York, and everyday life needs like health insurance became difficult to secure. Reagonomics, the policy initiated during the term of President

---

Ronald Reagan of a free market economy, took hold. For the art market, this meant a period of wild escalation in the prices of artists’ work and increased corporate art buying until the late 1980s when political conflict based on different values erupted. Dubbed the Culture Wars, this conflict frequently centered on the work of visual artists, most notably work that was called homoerotic, blasphemous and obscene, by photographers Robert Mapplethorpe and Andres Serrano. Since the work of these and other artists was funded directly or indirectly by the National Endowment for the Arts, it too came under fire, resulting in lengthy legal battles and the elimination of most grants to individual artists by the NEA.

The art market itself, which took a dive after the Culture Wars, bounced back a decade later, with an expansion into countries that had not played singular roles in contemporary visual art including Indonesia, Russia and China. Auction houses, art fairs, expositions and galleries pursued what cultural critic Robert Hughes calls “the shock of the new” but generally not to the benefit of the regular artist, the one who had spent a lifetime making art but didn’t happen to be an art star.

Background

“Art is the only thing that’s left in the world.”
—Homeless mixed media artist, age 72

To focus on older artists means, of course, to take into account the artist’s entire career. This includes the context of a marketplace where collectors in the 21st century have been coaxed to acquire art as an investment hedge against the future and have been privy to fad-shaping, and celebrity sightings. At the other extreme, the artist is condemned to obscurity. In between there are outsider artists, naives, and those whom the marketplace cannot categorize at all. And then there are the many artists, neither famous nor obscure, who commit their daily lives to their art.

The process of the artist, especially as s/he enters and proceeds through old age, can shed particular light on the artist as a “problem finder”, a model not for a particular job or even a particular career, but for how to go about proceeding through life. In their ground-breaking study, The Creative Vision, psychologists Jacob Getzels and Mihaly Csikszentmihalyi, described fine artists in this way, not only as problem-solvers, but as problem-finders. The artist, said Getzels and Csikszentmihalyi, is one who essentially creates his own problem and then goes about finding ways to solve it. In this aspect of the artist’s life, which Csikszentmihalyi found so central to the artist’s development, the elements of discovery, origination and imagination are central to creativity and to the artist’s search for truth. The artist’s ability to formulate problems, the authors say, “entails a process far more in touch with the deepest layers of being than reason alone usually is.”

This model of the artist, not only as problem-solver, but as problem-finder as the artist moves through physical and mental challenges and possible disabilities, potential changes in social status, social services, living arrangements, and income generation, may provide some prescriptions for people as they age.

The Aging Population

The cohort called the Baby Boomers has now reached 60 (every day 8,000 more people turn 60), and 1 out of 5 Americans is projected to be over 65 in 2025. By 2050 86.7 million people will be 65 and over and 20.9 million, 85 and over.

- About 1 in every 8 people (12.4% of the American population) is an older American (65+).

• In 2005 the older population (65+) numbered 36.8 million in the United States, an increase of 9.4% since 1995.

• By 2030, the older population will more than double to about 71.5 million, representing nearly 20% of the U.S. population.

• In 2003, people reaching age 65 have an average life expectancy of an additional 18.4 years (19.8 years for females; 16.8 years for males).39

• Among the elderly population, those 85 years and over showed the highest percentage increase, an increase of 38% from 3.1 million in 1990 to 4.2 million in 2000.40

In New York City’s five boroughs the over-65 elderly population (937,900 in 2000) is projected to grow to 1,352,000 by 2030 with the bulk of the increase after 2020. While the population is expected to increase 13.9% between 2000 and 2030, the increase in the elderly population is expected to be 44.2%! After 2010 Manhattan and Staten Island will experience the greatest growth in elderly populations-in Manhattan by 2030 it will account for 16.1% of the borough’s population; in the other boroughs it will be over 14.8%. According to NYC’s Population Projections 2000-2030 Report, “The increased longevity of the population, combined with a more substantial share of the city’s population that is elderly, portend a new demographic era in the city’s history.”41

While the statistics tell one story, cultural commentators tell another. Margaret Morganroth Gullette describes “middle-ageism” as a “one-two punch”: one, the kind of ageism Robert Butler describes in images and advertising of older people and two, a set of economic “brass knuckles” caused by downsizing, outsourcing, technological advances and discrimination.42

**Immigrant Populations**

New York ranks third among states for the number of older people and is one of the few states where patterns of immigration and minority status will help shape the state’s future profile.43 This is also true in New York City. Therefore, this study deals head on with issues including language, inclusion, use of social systems, educational training in home countries and recognition.

In 2000, 35.9% of New Yorkers were foreign-born (2,871,032) compared to 11.1% of the total U.S. population; over 70% entered New York in 1980 or later. Thirty-two percent are from Latin America, and 23.9% from Asia; 32.5% of foreign born live in Brooklyn (931,800) and another 35.8% live in Queens (over 1 million). Immigrants and their U.S.-born offspring account for approximately 55% of the city’s population.44

As the graying of America progresses and the baby boomers begin to enter their twilight years, government and other agencies are deep in discussion over issues of physical and mental health care, Social Security, retirement and pension benefits, and attitudes and policies towards aging. Traditional solutions to the challenges listed above are no longer sufficient. A plethora of programs from ‘lifelong education’ to more user-friendly assisted-living facilities have been created as we grapple with social and public policies towards aging.

**Freelancers**

Ongoing research shows that people with “robust” networks tend to stay out of nursing homes and that people with diverse networks gain benefits

---

43 Prosper. 14.

to their quality of life. Our feasibility study indicated that artists are among those with robust networks. In addition, the irregular nature of the artist’s career trajectory—multiple and sometimes discontinuous jobs, day jobs and art jobs, movement in and out of paid employment, and the documentation of major career turning points give us important evidence to apply to the growing population of freelancers in the U.S.\textsuperscript{45} (It is estimated that there are 10 million self-employed workers in the U.S.\textsuperscript{46} According to Creative New York, 53.8% of artists and related workers in New York are self-employed.\textsuperscript{47})

New York City’s freelancers have a profile of people who might learn from our visual artists in many ways—it must be noted that over half of those surveyed by The Freelancers Union were aged 25-39 and only 9% were over age 50. These comparative data, therefore, may be a watchword for younger freelancers as well as artists in New York City:

- 59.6% have a college degree (28.4% of aging artists have an undergraduate college degree; 29.1% have an additional Master’s and 2.1% have an additional Doctoral degree.)

- Their median income is $50,000 (20% higher than the city’s overall median). For freelance artists the median income is $39,250.\textsuperscript{48} The median income of our visual artists is $30,000 (more like New York’s overall median). About 28% of freelancers spent a portion of the previous year without health insurance; in 2006, this rose to 39%.\textsuperscript{49} In our study 6.9% have no health insurance.

- 80% of freelancers avoided seeking medical help when they were without insurance;\textsuperscript{50} 4.6% of visual artists said that, in the previous year, they needed to see a doctor but didn’t go. 26.0% had severe or chronic health problems. While 93.1% had health insurance, 19.7% said this coverage is not adequate to their needs as artists. Eighty percent have Medicare and none of the respondents receives health insurance from a private company.

- According to Working Today, the average independent worker earns between $21,000 and $50,000 annually and could afford premiums at $83-208 per month; the average HMO in Manhattan is $442 per month.\textsuperscript{51} The out-of-pocket costs for the majority of aging visual artists for 2005 was under $5,000.

- Under half (47%) of freelancers save money for retirement each month,\textsuperscript{52} in 2006, half saved less than $10,000 towards retirement.\textsuperscript{53} Eighty-five percent of freelancers said that unstable income is a disadvantage of working independently, especially since unemployment benefits are designed around traditional work.\textsuperscript{54} The 60.1% of aging visual artists who have retirement plans other than Social Security may be a percentage that changes drastically in the near future, with the raising of the eligibility age for full benefits and cuts to Social Security being threatened.

According to a recent RAND study, rates of self-employment increase with education level; self-employed men work more hours and weeks a year than their wage and salary counterparts, and the self-employed, overall, have higher rates of job satisfaction than their wage and salary colleagues.\textsuperscript{55}

\textsuperscript{54} Horowitz, 2005 Report.

The analysis of which artists 62 and over are doing well financially, physically, mentally, emotionally and situationally and the comparisons of our findings with current and recent research on aging will give us deeper insight into the process of aging as well as the strategies to cope with aging, including communication with other artists, self-esteem, and positive and negative emotions in relation to their art.

What is an Aging Artist and Why New York?

The term “aging artist” includes but is not limited to, a person who has spent the majority of his/her lifetime working in one or more art forms and who considers himself/herself an artist. Gerontologist Bernice Neugarten first separated older people into two groups—the “young-old” from age 65-74, generally considered highly functional and well, and the “old-old” over age 75, more likely to be frail. Other researchers characterize those 75-85 as the “old-old” and those 85 and over as the “oldest-old.”

In this study, the term aging refers to a person who is age 62 or over (62 is the official eligibility age for Social Security), clearly a chronological demarcation. In addition to the impact of physical aging of artists, “artistic aging”, e.g. artists’ perceptions of the artistic maturity of their careers, was also explored as artists described how the aging process affected their creative process.

It is well-known that New York is the Mecca for artists. In May 2006, according to the Bureau of Labor Statistics Occupational Employment Statistics, in New York’s Metropolitan Statistical Area there were 127,640 artists including: 5,550 Actors; 5,630 Musicians and Singers; 1,040 Fine Artists (including painters, sculptors and illustrators); 2,800 photographers, with another 2,320 Multi-Media Artists and Animators, and 3,440 Writers and Authors. According to Creative New York, 7% of the country’s fine artists are in New York City (53.8% of these are self-employed in all jobs; 47.6% in their primary job). In addition to numbers of artists, the New York Metro Area abounds with service organizations, arts-related businesses, artists’ housing, conservatories and training academies. In essence, a highly developed support structure exists where, at the same time, artists are being used for gentrification, economic impact, and fueling creativity. In order to understand the challenges and realities of aging artists in one of the most supportive and harshest environments in the country, this study can be a model for understanding artists’ realities in other urban centers.

Research Approach and Method of Study

In order to ensure that we could reach our desired population of visual artists aged 62 and over in New York City using a method called Respondent-Driven Sampling (RDS), we conducted a feasibility study that showed that this population had sufficient personal networks of other aging visual artists in the five boroughs, rich connections to their peers and a willingness to participate in such a study.

In addition to the feasibility study, meetings with two focus groups and an advisory board, we conducted an ongoing literature review and built our questionnaire so that comparisons with several important data sets on different aspects of aging were possible. We also included questions from former RCAC artist studies over the last twenty years for comparative purposes.

The final questionnaire included basic demographic information followed by 195 questions, and was vetted by the Internal Review Boards of both

---

56 Rowe and Kahn., 9.
60 Keegan et al., 3; 23.
61 Respondent-Driven Sampling was developed by Dr. Douglas Heckathorn at Cornell University for his work in the health care and HIV communities. It was first adapted to the arts by Joan Jeffri, with his collaboration, for a study of jazz musicians commissioned by the National Endowment for the Arts in 2000. (Changing the Beat: A Study of the Worklife of Jazz Musicians, NEA Research Report #43). To our knowledge, this is the second full-fledged study using this methodology in the arts.
Teachers College Columbia University and Cornell University as well as by our Advisory Board. A mid-point analysis was conducted and presented to the Advisory Board and the New York Foundation for the Arts and their feedback was incorporated into the study.

The questionnaire was translated into Spanish and Chinese, then translated into English using standard forward backward translation processes to ensure consistency.

Respondent-Driven Sampling

Respondent-Driven Sampling (RDS) is a method used to reach hard-to-find populations. (See Chapter III for an in-depth description and analysis using this method.) The typical ways to find a study sample are location sampling (a public venue, for example, a gallery organization for visual artists) or through their affiliations with associations or organizations such as unions, clubs, fraternal organizations. Originally created in the late 1990s to reach HIV drug injectors by sociologist Dr. Douglas Heckathorn at Cornell University, the method is based on the assumption that initial respondents (or “seeds”) will identify others who are in their own social networks through a coupon referral system. Thus, as one person reaches another, the social networks begin to spread like the branches on a tree. When analyzing data, one can see which person referred another and also understand how their social networks are linked through economics, race, gender, location, etc.

This was a particularly useful method to reach this population, especially since the number of older Americans living in nursing homes has declined since the mid-1980s, making it difficult to reach older populations strictly through living arrangements.

Collaborations

One challenge in the arts research community and of utmost concern to artist respondents is the application of research into action. Our funders, the Pollock-Krasner Foundation and Cornell University’s Institute for Translational Research on Aging (CITRA) provided us with more than monetary resources. Focus groups with artists and arts managers were held at the Foundation (See Appendix for Focus Groups), and through CITRA we were able to use the expertise of a team of Cornell and Weill Medical School gerontologists as we conceptualized the study. IOAIII Aging collaborated and partnered with city organizations for aging, health care, housing and benefits as well as service organizations in both the arts and aging to turn our findings into action.

Our main partner in this effort is the New York Foundation for the Arts (NYFA) which, for thirty years, has been providing assistance, grants, and community connections for artists in New York State. NYFA has a strong reputation, and its informational resources are significant, particularly its “NYFA Source” the nation’s most comprehensive database of artists services and information. Armed with our research, NYFA will lead the New York arts community in advocating for and making changes in New York in these very areas once our study is complete.

Additionally, we held over a dozen “town meetings” hosted by arts and arts service organizations to speak to artists, managers, policy makers and government representatives. (See Appendix for Town Hall Meetings). We also established an Advisory Board for the Project whose members are well-known both in the artist and aging communities. (See back cover for Advisory Board)

The RCAC seeks to disseminate its findings to an array of constituents to influence legislation on aging, help retirement venues and other social service agencies adapt our findings for their constituents, provide a model that agencies can promote for new/alternative practices in aging, and influence arts and cultural funders to understand critical needs and develop programs for aging artists. It is our hope that this information will raise awareness and provide the

---

evidence to influence policy and resource allocation in agencies that deal with aging, artists, legislation, governance and advocacy.  

Challenges and Solutions

During the implementation of the study and ongoing interviews, challenges were encountered as the RDS method was administered (See Chapter III). In an effort to adjust and adapt the study as it went along, weekly meetings were held with project staff members and observations about how the study was going were shared. As they arose, these challenges were met with solutions in order to increase the validity and efficiency of the study.

Identification of Seeds and Recruitment of Others

The first set of challenges was the need to find effective, diverse key people that could successfully disperse a set of four coupons to other artists. Several measures were taken to identify these key people (called “seeds”) from ethnicities and networks that would disperse all four coupons to other artists throughout the boroughs. Our focus groups and town meetings helped us to identify artists who could serve as seeds. Additionally, cohorts of aging artists were identified in such places as Westbeth, the oldest and largest artist-only housing complex in the country, artist-filled studio buildings, communal art-making spaces (printmaking shops), art clubs and training grounds (Salmagundi Club, Art Students League) and other community centers catering to artists or older persons (nursing homes, hospices, senior centers). Once selected, seeds were contacted by phone to remind them how to disperse their coupons and to do so as soon as possible.

How old is aging?

As the coupons were dispersed interviewers were sensitive to the reluctance of some artists to state their ages, and to the term “aging” which some artists felt furthered the stigma and discrimination of older artists. Although all the artists interviewed were age 62 or over, some artists said they were not “that old”. Artists age 62-66 tended to view themselves as “new” old people and not in the same category as “old” - artists 70+. Artists who just turned 64 did not want to be seen in the same category as a 70 year old. On the flip side, older artists age 85+ would comment, “How old is that artist? 68? She’s a baby.” This corresponds to the literature on aging mentioned previously which separate the “old” into 3 age categories: 65-74 as “old”, 75-84 as “older old” and over 85 as the “oldest old.” In a National Council on Aging Study nearly half the people 65 and older consider themselves to be middle-aged or young.

Life review

“Life can only be understood backwards.”
—Søren Kierkegaard

Some artists felt that the length of the interview (sometimes 2.5 hours) was a distraction from their work and other priorities that vied for their attention. Portions of the survey asked respondents to reveal personal information and details about their lives that may have been previously published in articles or books. A few artists felt that their biographical information, art work and reviews were already documented and accessible to the public. As is often the case with research studies, participants may feel that the results of their efforts will not make a difference in their own lifetime. This is especially true for aging artists who felt that due to their older age, they would surely not benefit...
from their own efforts in the study. Nevertheless, giving the artist an opportunity to reflect back on his life and think about questions he may not have thought of before, especially those regarding well-being and awareness made the interview a kind of life review process. And, in some ways, for some artists, art is a life review.

Fragmentation

A number of cultural theorists point to fragmentation of the life course as an enemy to aging with the easy adoption of categories (like the baby boomers, Generation X) which often serve to divide groups instead of providing “connections and continuities.” For artists, their art provides a singular kind of continuity. This was evident often in our study when a physical condition like arthritis threatened an artist’s production of his work. The artist simply changed his medium to one more aligned with his physical capabilities. It didn’t seem to occur to him to stop making art.

Momentum, Continued Involvement, Diverse Populations

As the study progressed, it was critical to keep the momentum going and to circulate the coupons to new artists. While a modest amount of money was offered to artists for their interviews, we created a voucher booklet called The Artists’ Pass (See Appendix). This contained retail discounts from art supply stores and free seminars donated by art service organizations. We also culled a resource list for aging artists from the New York Foundation for the Arts and gave it to each artist at the interview.

Throughout the study there was a concerted effort to include immigrant artists. This proved difficult with the Hispanic population even though anonymity was guaranteed. At the opposite extreme were the Chinese artists, who seemed thrilled to be interviewed and passed out their referral coupons with great alacrity. However, they also tended to pass these along only within the Chinese artist community.

Dealing with Aging Populations

The most heartbreaking aspect of the study was interviewing artists who were sick, debilitated, depressed, poor, or helpless. Unlike certain kinds of other surveys, this one required interviewers to be able to conduct the study and be sympathetic to a range of issues and situations in which they encountered emotions from hostility to despair. Several artists died during the study. One 91-year old printmaker passed away on the day his interview was scheduled. A few months later, the artist’s daughter called informing us that he had taken his interview coupon with him to the hospital.

Social Networks

From the studies on aging by the MacArthur Foundation and others, social relationships and support networks have been linked to longevity. In our feasibility study we were concerned about the isolation of older artists, especially visual artists who often work alone. We were surprised at the frequency of communication in artist networks both in the feasibility study, which looked at all kinds of artists, and the current study which focused on visual artists.

According to Rowe and Kahn, there is a “surprising stability in the size of support networks throughout the life course”; on average, personal networks include 8 to 11 members. Aging artists’ networks have 5-7 members in our larger sample, but professional artists’ personal networks average 29. Rowe and Kahn also state that people are healthier, on average, who have a great deal of social support.

At a time when aging may be the next big concentration for theorists to make a difference to the general public as well as the social sciences, the humanities, cultural studies, the media, and the medical/industrial complex, “maturity without seniority” can cause people to “internalize their worthlessness.” This study focuses on a largely self-motivated body of creative factors: the artists’

---

66 Gulette, 194.
67 Rowe and Kahn, 160.
68 Gulette, 88.
engagement, their problem-solving and their strategies for survival. Artists are providing society with a beacon to a place where all of us are headed.

Gender and Race

While we do have some results for Asian populations, we do not feel there are substantial numbers to make definitive predictions by race although Chapter III provides some interesting analysis about social networking according to race. While we often compare data according to gender, it is clear that both gender and race have significant impacts on income, health, and discrimination of the aging population. Research supports, for example, that the situation of older blacks is one of “double jeopardy”-a combination of age and race.\(^{69}\)

Future phases of this study of performing artists and in other cities will increase confidence in these reporting areas.

Wisdom and Harmony

Whether referring to Erik Erikson’s 8 developmental stages of life towards what he called “ego integrity” or Robert Butler’s “Life Review,” a goal of much psychological gerontology seems the achievement of harmony or what many have dubbed the wisdom of age. Not everyone agrees with this perspective, and even Butler realizes that reviewing one’s life may have negative results instead of providing positive resolution of conflicts and closure.

One stereotype is that wisdom features prominently in old age, while creativity and achievement are the preserve of youth.\(^{70}\) This view dismisses the notion that an accumulation of life experience feeds creativity, something borne out by our interviews. Lehman and other authors who claim that painters peak in productivity in their 30s or 40s are fond of citing visual artists from Michelangelo to Georgia O’Keeffe having “secondary peaks.”\(^{71}\) Others disagree that older people are less motivated to achieve.

But with age also comes anger for some people. Kathleen Woodward claims that “Wisdom carries the connotation of dignified behavior, hence the further difficulty of its association with a rhetoric of protest.” She cites that for a long time angry women have been labeled hysterical or irrational and pleads for changing “what has been called an affect script for older people in our culture.” She recommends that we can do this by telling stories, essentially something that all artists do in their own forms.\(^{72}\)

In the famous Berlin Wisdom Project, Laura Carstensen and others have tackled this subject and the language of wisdom is not often definitive. Definitions are also often a reflection of Western notions. In one cross-cultural study, researchers found that Americans and Australians equated being wise with being knowledgeable and experienced (being old and discreet were not as desirable), while in Japan and India, wisdom was linked to being discreet, aged and experienced.\(^{73}\)

Psychological models of “successful aging” have highlighted evidence of positive personal growth, creativity, self-efficacy, autonomy, independence, effective coping strategies, sense of purpose, self-acceptance and self-worth.\(^{74}\) Artists, as our study makes abundantly clear, are engaged in all of these indicators, especially with their art as a barometer.

CHAPTER II
Findings

Artist Definitions

Definitions in artist studies are always problematic. While there has been substantial progress in the community of “Creative Aging”-people who turn to art as they age for a myriad of reasons, our contribution can be felt most by its focus on professional artists. Since there is no official vetting body in the U.S. and no employment system that proves professionalism, there are 2 main ways we determined this status:

1. Respondent-Driven Sampling: By using this method of coupon referrals, at the end of each interview the artist was asked to give four coupons to peers who were 1) 62 years old and over, 2) a resident in one of the five boroughs of New York City and 3) a professional visual artist.

2. The in-person interview included an opportunity for artists to self-declare as professionals, given 7 choices. These categories resulted from focus groups held at the beginning of the project and are validated by over 20 years of research conducted by the Research Center for Arts and Culture.

   A1. I consider myself an artist.
   A2. The main body of my activity is some form of art.
   A3. I have a demonstrated record of exhibition, performances, installations, publications or other evidence of my art.
   A4. My main priority is to make art.
   A5. I spend the majority of my time making art.
   A6. I have been formally trained/educated as an artist.
   A7. I make a living as an artist.

Of 213 recorded interviews, 146 respondents selected at least 2 of the above categories, the most frequent being the first 2 categories, self-definition and that the main body of activity is some form of art. The results presented here are based on the responses of those 146. In Chapter III there are some comparisons between professional and non-professional artists. The fact that 67 respondents in our entire sample could be classified as “amateur” shows that, even in the artist community and through peer solicitation, such definitions vary.

In this study, the term aging refers to a person who is age 62 or over (62 is the official eligibility age for Social Security), clearly a chronological demarcation. In addition to the impact of physical aging of artists, “artistic aging”, e.g. artists’ perceptions of the artistic maturity of their careers was also explored as artists described how the aging process affects their creative process.

Of 146 professional artists, the mean and median age is 73: 73.3% of all respondents were White; 12.3% Asian; 9.6% Black; 4.1% Hispanic; 23.5% are single; 40.9% married; 21.2% divorced and 12.1% widowed. The remaining 2.3% are separated or in a domestic partnership. 39.7% are male; 60.3% are female.

Generationally, 43.5% are first generation, 27.5% are second generation and 19.6% are third generation respondents. Over 98% are U.S. citizens.
HYPOTHESES AND PERTINENT EVIDENCE

There were ten hypotheses we posited about aging artists. These were based on concerns in both the artist and the aging communities. We follow these with additional areas of investigation.

RETIREMENT

In New York City in 2003, there were 512,000 people aged 55 and older in the workforce, 384,000 between 55 and 64 and 128,000 65 and older. Interestingly, for the population 65 and older, Asians reported the highest percentage of their population (14.3%) in the workforce (with 19.6% for men and 10.4% for women), followed by African Americans at 13% (19.2% for men and 9.7% for women).75

Hypothesis 1: The retirement age for artists is likely to be much higher than for the general population.

As life expectancy is expanding, retirement age will most likely lengthen for the general population. Even with the elimination of a mandatory retirement age and the lowering of the age limit for Social Security benefits from 65 to 62, many artists continue to work on their art even as they age, some with no regular formal employment.

Studies on retirement timing and patterns give “increasing attention to work after retirement, partial retirement and bridge jobs between the end

---

of a career job and the full exit out of the labor force.” Additionally the concepts of a) “self-defined retirement” when workers may actually be retired from one job but working at their art and b) work later in life that involves movement into new forms of work, whether art-related or not are areas germane to aging artists. Retirement, described by the National Council on Aging (NCOA) as a “process” rather than an “event,” is changing radically. While 58% of the NCOA study respondents (65 and older) were completely retired in 2002, 23% described themselves as both “retired and working” and another 19% as not retired. One scholar using the Health and Retirement Study data shows that half of retirees follow a non-traditional retirement path that involves partial retirement or unretirement; 24% of retirees later unreitre, among them, the more educated for whom out-of-pocket medical expenses are lower.

Lindauer states that “artists as a rule remain actively engaged into their 70s, 80s and longer, rarely retiring until very late in life, if ever, unlike aging members of other occupations.” For 144 of the 146 professional visual artists, in relation to their artwork, 80.4% said they were not retired from art and 12.6% said they were semi-retired. Only 3.5% (5 respondents) said they were retired from their work as an artist and 70.6% (84 artists) were retired from another job. When asked when they would retire from their art, of 48 respondents, 87.5% said they will never retire from their art.

While 76-78 million baby boomers approach retirement, the Employee Benefit Research Institute claims that almost 25% of older baby boomers (48-56 years old) have no retirement savings.

Compared to the general population as of 2003, 70.3% of all older workers (55+) had some type of retirement plan coverage in 1998. In our findings, 60.1% of artists 62+ have such plans; more female than male artists in our study have retirement plans other than Social Security (66.3% versus 50.9%). In an earlier study of artists 55 and over in four U.S. cities, 64.2% had at least 1 retirement plan. The expectation of some researchers is that those “having uneven, or downward, career pathways” would be less likely to plan for retirement.

Seventy-five percent of aging artists have Social Security (average $4,820 annually) compared to the University of Michigan study where 61.9% of respondents received Social Security benefits. In the general population, older female workers were less likely than their male counterparts to have a pension plan-66.7% compared to 73.4%. This difference is mainly due to higher pension coverage from previous jobs for men than women.

Older workers with more education were more likely to have retirement plan coverage than their counterparts with less education. Highly educated older workers were especially likely to have high IRA participation. This is probably a result of both pension rollovers and these workers’ higher propensity to save. Forty percent of white workers in the U.S. have IRAs.

highly educated. 73.8% said they have an IRA (of 104 respondents); 21.4% said they had a 401(k) plan.

“For me to retire from painting would be to retire from life.”
—Robert Motherwell, age 71

Research on social status has shown that it is determined largely by occupational prestige; for this reason, after retirement, such status is difficult to maintain.90 This may be one reason that of our artists, most of whom do not retire from their art, 67.2% regularly experience feelings of self-esteem in relation to their art.

In some societies, like those of the Hopi Indians, the elderly assume greater importance in ritual affairs. In China where the common retirement age is 55, lao-nien is the stage of “old age,” a time for the elders’ pleasure and reflection.91 In the U.S., the notion of retirement often equates with uselessness and “social death.”

In America and other cultures, work is an important part of personal value, both through society’s opinion of an individual and an individual’s opinion of himself (or herself). Retirement involves a diminution of that value. Besides losing social contacts and the status that a job title carries, persons who do not work may have feelings of uselessness. ‘Active engagement with life’, which includes…’continued involvement in productive activities’ is a key element in ‘successful aging’ …older individuals who remain productive are behaving in a way that improves the chances for continued personal happiness.92

Another way to view attitudes towards retirement is to consider that some artists may have no retirement age at all and may view traditional retirement plans differently. For Chinese artists we interviewed, some who have been in the U.S. for twenty years, their understanding of retirement plans may be hindered by their inability to speak English and knowledge to navigate Western benefit systems. In fact, the data show that 47.1% of Chinese professional artists are without retirement plans.

“I’ll retire when I’m in my coffin.”
—Jewelry designer, age 69

Findings: Over 60% of artists have a retirement plan other than Social Security. More women than men have retirement plans other than Social Security. Over 80% of artists are not retired from their art. Professional artists say they will never retire.

CAREER SATISFACTION

Research speculates that workers who have frequently moved in and out of jobs, employment, or the work force may be less invested in their careers and less attached to the work force.93

Hypothesis 2: Artists are very invested in their careers, even if they move in and out of the workforce and hold multiple jobs

Wilensky defined careers as “a succession of related jobs, arranged in a hierarchy of prestige, through which persons move in an ordered (more or less predictable) sequence.”94 He and other sociologists identify linkages

---

93 Han and Moen., 191-236.
94 Wilensky., 523.
between jobs and careers. Other analysts believe there is no such linkage. Still, others posit that certain careers involve career movement through a hierarchy of power or control. Crane and Faulkner discuss job movement within the confines of a social network and Becker and others have formulated that career success must be defined in terms of a subculture's criteria. Our efforts in this study combine many of these points of view—movement within a social network (the contemporary visual arts world provides one such network) a subculture, in this case of aging visual artists in New York City’s and differing views of the “career” of being an artist.

Over half of the painters we studied in the 1990s stated they were satisfied or very satisfied with their careers (in that study the mean and median age was close to 40). In 2006, older artists seem equally satisfied. However, younger artists might have been more optimistic about their careers with so much time ahead of them versus older artists who stated their satisfaction levels based on actual experience. Of 143, 55.3% are satisfied or very satisfied with their art work, 42.7% are satisfied or very satisfied with their artistic careers and 55.9% thought they had made the best work of their lives. In the 1990s, 87% said—if they had it to do over again—they would still choose to be artists. In 2006, an overwhelming 91.4% said the same.

A topic that surfaced frequently in interviews reflected the mores of the times in which artists matured and the idea that being an artist was not considered a “career.” Traditional societal female roles applied to the arts as well; a number of women who were divorced or widowed found it possible to sustain themselves as artists only after separation from their spouses, some of whom continued to support them financially through pensions, divorce settlements, inheritance. As in many other careers, marriage and children resulted in some female artists putting their artistic careers on hold until their children were grown as well as those mothers who expressed guilt that they put their artwork above or equal to the raising of their children.

In terms of life satisfaction, we assessed artists according to the Diener Satisfaction with Life Scale (SWLS). Individuals who score between 25 and 29 (considered a High Score) like their lives and feel that things are going well. Of course, their lives are not perfect, but they feel that things are mostly good. Furthermore, just because the person is satisfied does not mean he is complacent. In fact, growth and challenge might be part of the reason the respondent is satisfied. For most people in this high-scoring range, life is enjoyable, and the major domains of life are going well—work or school, family, friends, leisure, and personal development. The person may actually draw motivation from areas of dissatisfaction.

People who score in the 20-24 range (considered an Average Score) include the average of life satisfaction in economically developed nations—a person scoring in this range is normal in that he has areas of his life that need improvement. However, an individual in this range would usually like to move to a higher level by making some life changes.

ARTISTS SHOW A SIMILAR OR GREATER SATISFACTION WITH LIFE THAN THE GENERAL POPULATION

job situations tended to influence their satisfaction with life in general,” rather than the reverse. Artists’ validation comes primarily from solving their own aesthetic problems, and next from their peers. (This was confirmed from our earlier study of painters as well as in this study.) For some, the studio is their home and identity. The price paid for the work, the gallery or museum in which it is shown, even the reaction of the public are all secondary. As to the relevance of art to the general public, one artist commented, “It’s like pushing sh_t uphill.”

Scholars like White and White, Raymonde Moulin, Pierre-Michel Menger and Howard Becker are often referenced in discussions of artists’ careers. Their work on the art world, the art market, the artist as freelancer and the artist’s reputation is substantial. It is Becker’s theory of artists’ roles that is most germane here. Becker divides artists into integrated professionals, mavericks, folk artists and naives. Integrated professionals belong to an art world whose conventions “they know, understand, and habitually use” within fairly standard problems and solutions.”

While most of the professional artists interviewed for this study would fall into this category, some would consider themselves mavericks, or innovators and for some of our immigrant artists those common conventions may be difficult to understand and even more difficult to use.

In the Stanford-Terman Study, 1/3 of the women and 2/5 of the men said they would change nothing about their lives if they had the opportunity to live their lives again. Artists are more satisfied. Almost half of both the females (47.6%) and males (49%) said they would change almost nothing about their lives.

Findings: Professional aging artists are satisfied both with their work and with the identity of being an artist. They rank high in life satisfaction scales and are very invested in their careers, though they may not refer to them as “careers.” Sixty-three percent feel validated or very validated as artists. Fifty-six percent think they have made the best work of their lives. What might seem a contrary finding is that the nature of making art work often implies that the creator is never satisfied. This often acts as a motivation for future work.

GENDER AND SOCIAL NETWORKS

Hypothesis 3: We suspect that, as women artists age, they will also have larger social networks than men.

Gurung, Taylor and Seeman posited that “Gender is one of the most robust predictors of social support. Women receive and give more support over the life course and women experience greater benefits from social network interactions.” They add, “People are motivated to maintain their social network sizes as they age, although there may be changes in the composition of the networks.”

While men and women’s social networks were relatively the same in the larger aging artists sample (5-7), as Rowe and Kahn’s estimate for the general population of 8-11, the average personal visual artist network size for both genders is 29 (See Chapter III).

As interesting as the number in people’s social networks is the homophily or tendency of people to associate and bond with others like themselves. Homophily is much higher for women (49.1%) than men (34.4%), very high among Whites (54.6%) and somewhat high among black artists (38.9%). If

Informal Social Care

Artists may be involved in what social workers call “informal social care.” Among the major needs of support for older adults, in addition to the carrying out of daily living tasks and help in times of illness or crisis, is socialization and personal development. Artists may have changed the typical “hierarchical compensatory” pattern where older people depend first on kin, then friends and neighbors, and lastly the government or other organizations. These “informal supports” provide a unique value in the welfare of older persons.  

At least a third of the elderly of the U.S. population is childless and perhaps without other family members to act as surrogates: 23.5% of our respondents are single and an additional 34.8% are separated, divorced or widowed. 19.6% have no children; 35.1% have no grandchildren and 13.3% have no siblings.

In 2003, 23% of men and 50% of women 75 and over in the U.S. were living alone. For those age 65-74, 26% of men and 46% of women lived alone. Our findings report that half of aging visual artists live alone. Yet, they are not isolated; 77% communicate daily or weekly with other artists.

Findings: The size of networks for both male and female aging artists are close to estimates for the general population (8-11). Aging artists have an average personal network of 29.

SECURITY

Research shows that older adults’ relationships with their spouses and children, but not with other individuals are related to feelings of security.

Equally interesting is the self-identification by class. In comparison with Occupational Prestige Studies of people 62 and over, more aging artists self-identify as lower class, and fewer as working class. The majority of respondents in both cases are middle class.

---

109 The Occupational Prestige Studies.

111 Ibid.

113 Ibid.
Hypothesis 4: We speculate that this will be different with older artists because of the strong relationship they have with their work and other artists. Thus, aging artists will find more security in other artists.

- Of 93 respondents 71% said they communicated with their partner daily. 25.8% said there is no such person.
- Of 97 respondents 42.3% said they communicated with their children weekly; 19.6% said there is no such person.
- Of 129 respondents 76.7% communicated at least daily or weekly with other artists.

In the previous 6 months, females communicated with an average of 33 visual artists age 62 and over and males with 32. Black visual artists communicated with 41, Whites with 35, Manhattan residents with 35 and Brooklyn residents with 47.

- For 48.8% of 121 respondents, their spouses are very supportive of their artwork; 40.5% have no spouse.
- For 57.1% of 126 respondents, other artists are very supportive of their work; for 36.5% they are somewhat supportive.

Three quarters of aging visual artists say they would miss artistic self-expression (somewhat or very much) were they to retire; 65.1% say that if they were to retire they would miss (somewhat or very much) the self-esteem and social status associated with being an artist; and 55.1% say they would miss the camaraderie and social networks. This is testimony to the close networks artists form.

Sadly, for 44.1% of the artists, between 3 and 10 artists 62 and over in their network have died in the last year and for 6.6% more than 10 artists have died.

Findings: Older artists’ strong relationships with other artists (77% communicate daily or weekly) trump their communication with partners, family and children. These artists are more supportive of their work.

Awareness and Well-being

Related to the issue of security is the emotional situation of being an artist. While this study did not administer standard mental health tests, it did ask artists about a series of positive and negative experiences in relation to their art as indicators of their subjective well-being.

- Of slightly more than 100 artists, 47.1% said they experience/feel anxiety on a regular basis in relation to their art work or being an artist; 26.9% said they experience depression; 26.9% loneliness; 18.4% self-centeredness; 15.5% helplessness. 10.7% loss; 29.1% vulnerability.

- Of 137 respondents, 77.5% said they experience/feel a sense of awareness on a regular basis in relation to their art work or being an artist; 63% introspection; 54% intensity; 51.8% love; 69.3% self awareness. Of 138 respondents; 59.9% flexibility; 71.5% gratification; 62.8% happiness; 60.6% humor; 57.7% joy; 69.3% passion; 64.2% satisfaction; 67.2% self esteem.

There is anxiety about growing older for 57.1%. Of these, 61.2% said this anxiety had to do with their health; 20.5% with their financial situation. Only 6.1% said their anxiety was about losing their network of contacts.

We also wondered how artists viewed their own self-esteem, especially since Erikson and others have seen this as an important subject:

Self-esteem declines in old age. The few studies of self-esteem in old age suggest that self-esteem begins to drop around age 70 (about the age when Michelangelo began working on the Florentine Pietà). This decline may be due to the dramatic confluence of changes that occur in old age, including changes in roles (e.g., retirement), relationships (e.g., the loss of a spouse), and physical functioning (e.g., health problems), as well as a drop in socioeconomic status. The old-age decline may also reflect a shift toward a more modest, humble, and balanced view of the self in old age (Erikson, 1985). That is, older individuals may maintain a deep-seated sense of their own worth, but their self esteem scores drop because they are
increasingly willing to acknowledge their faults and limitations and have a diminished need to present themselves in a positive light to others. Consistent with this interpretation, narcissism tends to decline with age.\textsuperscript{114}

137 artists answered a question as to how they felt about their self-esteem “on the whole”: 14.6\% said “excellent”; 34.3\% said “very good” and 33.6\% said “good” Fifty-two percent rated their quality of life in the past year good or very good; an additional 23.4\% rated it excellent. Sixty-eight percent rated their general self-esteem as good or very good. Sixty-seven percent rated their self-esteem as an artist as good or very good; an additional 19.1\% rated their self-esteem as an artist as excellent.

Findings: It appears from these results that artists tend to feel more positive emotions than negative ones in relation to their work and to being an artist; 83\% said they felt good to excellent about their self-esteem on the whole and 87\% said the same about their self-esteem as artists.

Productivity

In the National Council on Aging Study, 41\% of the respondents 65 and older were concerned that as they aged they would not have enough opportunities to be productive.\textsuperscript{115} As our data indicate, artists tend to feel more positive emotions than negative ones in relation to their work and to being an artist. In speaking of their artistic growth, one-third felt that intellectual stimulation contributed most to their artistic growth and a quarter felt learning to work with new material did the same. For 71\%, art helps them resolve/confront conflicts and for 83\%, they feel they understand the “big picture” more now than when they were younger.

For those who make art, positive feelings may relate to what psychologist Mihaly Csikszentmihalyi calls “flow”—“the state in which people are so involved in an activity that nothing else seems to matter. The experience itself is so enjoyable that people will do it even at great cost, for the sheer sake of doing it.”\textsuperscript{116} He cites art as one of these activities. Flow creates “optimal experiences” which give people satisfaction and self-empowerment.

Although time, effort and cost were persistent issues for many artists, some described their art as a calling, a blessing, and gift. The overwhelming response from aging visual artists, especially in relation to their art, is positive in terms of engagement with their work, the condition of their health, and their self-esteem. Fewer than

\textsuperscript{115} The National Council on the Aging, Inc. 2002 Update: \textit{American Perceptions of Aging in the 21st Century.}

10% experienced abuse, alcohol abuse, dependency, drug abuse, guilt, irrationality, panic, self-abuse, and thoughts of suicide. This clearly refutes one stereotype of the artist as a morose, despairing wastrel and counters some common perceptions of both artists and the aging.

Bruno Frey cites many studies that have found that older people are subjectively happier than young people. Yale University epidemiologist Becca R. Levy testified before the U.S. Special Committee on Aging about her analysis of data from the Ohio Longitudinal Study of Aging and Retirement (people 50 years or older when the study began, were interviewed 6 times during more than 20 years). Levy found “that those who expressed a more positive self-perception on aging had a mean survival advantage of 7.5 years over those who expressed a more negative self-perception.” And psychiatrist Gene Cohen, in his work on participation in the arts, has shown proven health benefits which he characterizes as “Art is chocolate for the brain.”

Another female artist who began in advertising said that aging is not a physical process for her that impacts her artwork. “It’s a thinking process.”

EDUCATIONAL ATTAINMENT

**Hypothesis 5**: Aging artists are more highly educated than the general public. In 1950, 17% of the older population had graduated from high school and only 3% had a Bachelor’s degree. By 2003, 72% were high school graduates and 17% had a Bachelor’s degree.

According to both RCAC and other independent studies of artists over the last two decades, over 40% of artists have a Bachelor’s degree and another third have graduate degrees. In the current study, 28.4% have a Bachelor’s degree (certificate programs at places like Cooper Union, were later accredited to a 4-year Bachelor’s degree), an additional 29.1% have a Master’s degree and 2.1% have a Doctoral degree. Seventy-nine percent received art-related training in the 5 boroughs.

This is a fairly remarkable finding considering that the BFA and MFA machine did not really begin until after World War II and only the youngest of our aging artists would have benefited from it.

**Findings**: Aging artists, many born after the explosion in arts-specific higher education programs, display the same educational levels of younger artists, much higher than the general population. Over 3/4 received art-related training in New York’s boroughs.

LIVING IN POVERTY

In 2002, 10% of people age 65 and over lived below the poverty threshold. The artist community has been a particular target of the AIDS virus which can rapidly change the circumstances of even the most affluent, and in New York, artists have been seriously affected by the post 9/11 economic situation.

**Hypothesis 6**: New York Metro artists have a small but significant percentage living in poverty.

Thirty seven million Americans are living below the official poverty threshold—$12,755 a year for a couple in 2005. For Americans over age 65, the poverty threshold is $9,367. One in every 8 Americans lives in poverty; more than 90 million Americans struggle with incomes less than twice the official poverty threshold. In New York City, 20.3% of the population 65 and over live below the poverty level, an increase of 14% since 2000. According to this measure, 9.9% of older Americans lived in poverty in 2005, which

---

119 Cohen, 25.
120 “Older Americans Update 2000: Key Indicators of Well-Being.” 6.
121 Ibid.
122 United States Census Bureau 2005 American Community Survey.
represents a continued decline of poverty among this age group nationwide. Yet, the poverty rate among older adults living in New York City was twice the national rate: 20.3%.\textsuperscript{124}

Seventeen professional aging artists live below the poverty line according to household income listed above (17.7% of 96 respondents—it is noteworthy that not all artists answered this question), split almost evenly between men and women. Nine of these are White, 3 Black, 3 Asian and 2 Hispanic.

A 69-year-old female illustrator/artist/artist’s agent lost 30% of her income in 9/11. Although she got 18 months of free rent through FEMA, she may lose her studio.

In relation to the AIDS crisis and the terrorist attacks against the U.S. on September 11th, 2001: 26.2% mostly Manhattan and Queens residents had their finances affected by 9/11; 6 people (4.3%) had artwork destroyed by 9/11. For 18.6%, mostly white Manhattan artists, their living/working space was affected. Only 2 people (1.5%) said their finances were affected by the AIDS crisis.

Findings: There is a small but significant percentage of artists living below the poverty line. Not all artists answered this question. A small but significant percentage of aging visual artists were financially affected by 9/11 and had their living/workspace affected; 6 people had their artwork destroyed. Very few were financially affected by the AIDS crisis.

## INCOME AND EARNINGS

**Hypothesis 7:** Aging artists have a higher percentage of asset and pension income than the general aging population.

The 2005 American Community Survey Aging reported that in May 2007, the median household income for New Yorkers age 65 and older is well below the national average for seniors: $23,415 versus $28,722\textsuperscript{125} (compared to visual artists 62 and over at $30,000).

The median individual income for aging visual artists is $30,000 compared to $20,201 for men and $15,647 for women in the U.S. Census\textsuperscript{126} (for those 65+). In addition, Social Security (average $4,820 annually) does not contribute substantially to income, undoubtedly because artists, like other freelancers, often do not work at full-time employment which pays such benefits. Income from art represents about 6% of artists’ median individual income. Unlike the stresses observed in younger artists, aging artists are not so much balancing jobs with making art; they are balancing the clock with making art. In the Occupational Prestige Studies, the mean yearly wage before taxes for people 60 and over was $38,870, the median $37,000, both higher than for visual artists.

Eighty percent of aging artists earn some money from their art. Eighty-five percent sell their artwork; 64.5% of aging artists do not make their living as an artist yet and 85.0% said they sell their art work and have sold within the last 1-2 years. Only 3.6% never sold a work.

While artists may have convertible assets, their day-to-day cash flow needs may still pose difficulties. One conclusion might be that artists who have reached age 62 and have learned to survive in New York City are a tough and savvy group.

Sixty-eight percent were the chief wage earner in their household.

Income is also interesting according to statistics of the foreign-born in New York City. According to the 2000 Census\(^\text{127}\), there are 2.87 million foreign-born in New York City; 261,443 of them foreign-born Chinese, with almost 80% under age 64. The median household income for foreign-born from China in 2000 was $33,320; with three quarters not proficient in English. In our study the median household income for Asian (mostly Chinese) visual artists is $16,000.

**Other Income and Assets**

Forty percent earned some money from stocks and bonds in 2005 (54% of the University of Michigan older adults have stocks, bonds and mutual funds; 1/4 have more than $125,000 worth)\(^\text{128}\) and 79% have savings. Thirty-three percent (of 68) have more than $100,000. Half of 122 artists thought their savings were adequate.

• While 61.7% said their household did not own a car (understandable for people living in New York City), 66.9% said they had financial assets and 86% said they had enough money to live on in 2005. Social Security income: as stated, the average amount of annual Social Security income is $4,280, 74% receive Social Security; 62.9% of the University of Michigan study receives Social Security benefits—for 41% of these they receive between $500 and $1000 a month, more than our aging visual artists.\(^\text{129}\)

• Only one-third own a home or an apartment; 21.1% own a second home or apartment; 85.5% of the University of Michigan aging population study own or are buying housing.\(^\text{130}\)

Additionally, half (74) of our aging visual artists declared the mean value of their primary residence as $1,617,524 with a median of $600,000. We suspected that many older artists would use this as a nest egg, sell their property and leave New York. We were surprised to find that the overwhelming majority has no such plan.

• Half the New York artists in IOA II (1997) had at least one retirement plan and the majority was economically in the middle class. We assume this

---

\(^{127}\) The Newest New Yorkers 2000.

\(^{128}\) The University of Michigan Health and Retirement Study (HRS) surveys more than 22,000 Americans over the age of 50 every 2 years. Supported by the National Institute on Aging (NIA U01AG009740), the study paints an emerging portrait of an aging America’s physical and mental health, insurance coverage, financial status, family support system, labor market status, and retirement planning.

\(^{129}\) Ibid.

\(^{130}\) Ibid.
pattern has continued into old age and as stated earlier, 60.1% of aging artists have at least one retirement plan other than Social Security.

Findings: It is unclear whether aging visual artists are doing better or worse than the general aging population. Income from art, however, is a small percentage of the median income for both men and women. It represents about 6% of their median individual income. Nevertheless, 85% sell their artwork and make some money from their art.

CAREERS, IDENTITIES AND PROFESSIONALISM

Hypothesis 8: Aging artists have different views of the concepts of careers, identities and professionalism, particularly at the older end of the age scale.

The area of self-definition is a murky one for policymakers and others trying to work with artists. While we identified the criteria used to solicit artists for the survey, we also asked questions to indicate more traditional definitions of professionalism. Two criteria used by economists to determine professionalism are the amount of time spent on an activity and the amount of formal training and education. In our sample, 58.7% spent the majority of their time making art and 67.8% said their main activity is some form of art. Seventy percent said their main priority is to make art. Almost 80% were formally trained as artists. Fifty-two percent spend 20 or more hours a week making art and 30.1% currently teach art. The Art Students’ League and Cooper Union were regular training grounds for artists. For 16%, the GI Bill paid for their education after World War II.

Education was also recorded in less formal ways: 40.6% have experience as a mentor or master artist and 32.3% are self-taught. Four percent worked as artists in the WPA.

In addition to time, training and commitment, evidence of production in the marketplace also helps to define professionalism: 83.3% of aging artists have evidence of their art—exhibitions, documentation, reviews. Collector support is another indication of professional status; 67.4% have had collector support.

The economists’ final yardstick is income, delineated above, (and further in Chapter III) with aging artists earning a small percentage of their individual income from art.

Findings: While aging artists meet some standard criteria for professionalism used by economists (time spent on art work, formal education), the generations being studied did not come to maturity in the career-focused society we live in now. Their professional definitions are both broader and deeper than economists’ and their views are decidedly different.

MULTIPLE JOBS

Hypothesis 9: Based on the RCAC’s Artists Training and Career Project, there is some evidence that artists’ multiple jobs reinforce each other, rather than the assumption that artists would relinquish their non-arts jobs in favor of full-time art making.

Since many aging visual artists age 62 and over are not currently working 40 hour/week jobs, they are less likely to have multiple jobs to support themselves. However, with the demands placed on them in terms of money, time, health, and family, many artists would relish the opportunity to engage in full-time art making, if they are not doing so already. Only 19.8% (of 111 respondents) said they had to work at more than one job to support their art. Many expressed feelings of needing to complete what they started, and saving their energy to make art.

Findings: Unlike the stresses observed in younger artists, aging artists are not balancing jobs with making art; they are balancing the clock with making art.
HEALTH INSURANCE

Hypothesis 10: Even though almost all previous RCAC studies over the last two decades have shown a high percentage of artists with health insurance, we expect aging artists (even with Medicare) to resemble RDS jazz musicians, for whom half the number of unionized musicians had health coverage.\footnote{131}

Aging artists resembled professional artists in all other RCAC studies over the past two decades (and not jazz musicians): 93.1\% (of 144) have health insurance—89.7\% of males and 95.3\% of females.

It must be taken into account that the average age in the 2000 jazz study was much younger than in our current study of aging artists. In fact, the national percentage for those with health insurance is 84.4\%.\footnote{132} In the Occupational Prestige studies 95.5\% of all respondents had health insurance; for those over 65, over 99\% had health insurance.

In 2005 an estimated 46.6 million people were without any kind of health insurance coverage, but only 1.3\% were 65 and older. Most of the population was covered by private insurance (67.7\%), but 13.7\% received coverage through Medicare; 13\% through Medicaid and 3.8\% through military health care.\footnote{133} In 2003 the average health care costs for Medicare enrollees age 65 and over were $12,510. For those 85 and over, this rose to $19,658.\footnote{134} In 2003, the poor or near-poor 65 and older spent 27.8\% of their household income on out-of-pocket health care expenses.\footnote{135} In the University of Michigan study over half the respondents spent less than $200 in annual out-of-pocket healthcare costs. It also shows that out-of-pocket health expenditures are lower for people in their 70s and 80s than for those in their 50s since older people are covered by Medicare and some of the people in their 50s are not covered at all. However, it is well known that Medicare (and Social Security) may not last in the U.S.\footnote{136}

The chart below shows how New York City’s

\footnote{134}{ibid. 49.}

\footnote{135}{ibid.}

visual artists age 62 and over obtain health coverage as compared to the general population.

As noted previously, 86.3% of visual artists had out-of-pocket expenses that totaled $5,000 or less for healthcare in 2005 including insurance premiums, co-pays, and prescriptions not covered by insurance).

- 15.9% who said they have health insurance have an HMO.
- 79.7% have Medicare and none of our artists received health insurance from a private company.
- Of the 137 respondents who said they have health insurance, 80.3% said their coverage was adequate to their needs as an artist.
- 48.9% obtained their health insurance themselves, 14.7% through an employer and 10.8% through a mate/partner or spouse.

One special program created for artists without health insurance is Artist Access located in Brooklyn, NY. None of the respondents surveyed stated they participate in Artist Access. Other health insurance initiatives for artists are being explored by Leveraging Investments in Creativity which has been making matching grants and giving technical assistance to organizations in several states with the goal of health insurance for 100% of the artists in their funded communities.

**Health Status**

In terms of their health status, a 2002 study by the National Council on Aging reported that half the respondents age 65-74 and 42% of those 75 and over rated their health excellent or very good. In 2002-2003, 73% (non-Hispanic Whites) of the U.S. general population age 65 and over rated their health as good or better.

For visual artists, 83% reported they were in good to excellent health: 19.9% (29) reported excellent health; 28.1% (41) said very good; and 34.9% (51) said good.

**Findings:**

One way to interpret these findings is that if you do not have health insurance coverage figured out by the time you are 62, you are probably dead. This does not mean artists do not need help obtaining health insurance. They, like all freelancers, have a difficult time obtaining benefits before they are eligible for Medicare, if they lose their coverage, have pre-existing medical conditions, or cannot afford the exorbitant cost insurance requires.

**“Art is what it does for you.”**

—74-year old white female painter

In the University of Michigan Health and Retirement Survey 77% reported they were in good to excellent health with only 9% reporting excellent health. Although our artist findings are self-reported, in epidemiologic observation there is an inverse relationship between socioeconomic status and health.

- 66.2% said that their health status did not change in the past year. Asked about the change in their health status after retirement, 33.8% (of 80 respondents) said that their health status got “somewhat worse” and 17.5% said that their health status got “much worse.

---

141 Juster and Suzman.
• While 22.5% said they had no health problems and 51.4% had moderate health problems, 34.4% said their health problems limit the amount of time they can spend on their art; 34.4% said it limits their productivity.

One-eighth of the professional artists said their physical health problems caused them to experience difficulties in relation to their art work; less than 1% said their emotional/mental difficulties did. As in the Stanford-Terman study, Mental and Physical Traits of a Thousand Gifted Children: Genetic Studies of Genius,\(^{143}\) while the overall level of participation remained high in later maturity, there was a trend toward withdrawal from activities that were physically, psychologically and socially demanding. Aging artists are decidedly annoyed by the limitations of their bodies. They have to make time and conserve energy that they no longer have, working fewer hours in the studio. Sometimes their work gets smaller. Sometimes physical limitations make them change their medium—they cannot lift as much because their legs hurt or need resting or it is not as easy to get around. Seventeen percent said their health problems contributed to the content or direction of their work.

Artists are disappointed and frustrated when they have an illness and cannot rely on their strength as they did before. It takes them out for a period of years. If they did not make art during this time, the lapse in art making negatively affects them and their feelings about progressing in their art. Many artists expressed shame or embarrassment because they had not been able to work on their art for a period of time.

Astonishingly, the resilience of artists in relation to their art is a testimony to old age. All the artists we interviewed visited their studios on a frequent and sometimes daily basis, even if it took 1.5 hours to walk the three blocks to the studio. When the medium became too taxing—such as large-scale sculpture or paintings, not one artist talked of giving up art; s/he simply changed the medium.

**“No two eyes see the same.”**

—Male black homeless artist, age 65, half-blind in one eye

and socially demanding. Aging artists are decidedly annoyed by the limitations of their bodies. They have to make time and conserve energy that they no longer have, working fewer hours in the studio. Sometimes their work gets smaller. Sometimes physical limitations make them change their medium—they cannot lift as much because their legs hurt or need resting or it is not as easy to get around. Seventeen percent said their health problems contributed to the content or direction of their work.

Artists are disappointed and frustrated when they have an illness and cannot rely on their strength as they did before. It takes them out for a period of years. If they did not make art during this time, the lapse in art making negatively affects them and their feelings about progressing in their art. Many artists expressed shame or embarrassment because they had not been able to work on their art for a period of time.

Astonishingly, the resilience of artists in relation to their art is a testimony to old age. When the medium became too taxing—such as large-scale sculpture or paintings, not one artist talked of giving up art; s/he simply changed the medium.

**Findings: Contrary to our original hypothesis, aging artists resembled artists in all other RCAC studies over the past two decades (and not jazz musicians): 93% have health insurance—90% of males and 95% of females. Nevertheless, it must be noted that the median ages in all former RCAC studies cited here were between 38 and 40, and the median age here is 73. Therefore, one would expect aging artists to have figured out their own solutions for healthcare as evidenced by the 80% who receive Medicare.**

**RELIGIOUS AND POLITICAL AFFILIATION**

In the Stanford-Terman Study,\(^{144}\) older adults’ level of voter participation was substantially greater than that of the general population throughout

---

143 Stanford psychology professor Lewis Terman launched a study in 1921-1922 to investigate the maintenance of early intellectual superiority over a 10-year period. The objective was soon extended into the adult years for the purpose of determining the life paths of these Californians. The 1922 and 1928 data collections focused on family life and school experience; the i936 and 1940 follow-ups occurred at a time of educational achievement and the start of adult careers for many, whether marriage, family or work. At the next follow-up, questions were asked about the war and various service roles. The postwar years through 1960 were times of marriage, family development, career beginnings and accomplishment. Mail surveys investigated these and other topics in 1950, 1955, 1960. Various life changes within the Terman sample and new leadership from Robert Sears, Lee Cronbach, Pauline Sears and Albert Hastorf brought fresh attention to issues of aging, work life and retirement, family, and life evaluation in follow-ups in 1972, 1977, 1982, 1991-1992. These studies are generally referred to as the Stanford-Terman studies. One can see why this study has been called “the longest life-cycle study in the history of the social sciences” (http://www.sids.net/Terman.htm.) In a commentary on this study, the authors find that “although the sample as a whole achieved higher than normal levels of education and career success if one uses standard creativity criteria (impact, productivity, and honors and awards), the Terman group in general was surprisingly uncreative over the course of their careers. No major writers, artists, or scientists emerged from this “genius” level IQ group.” From Feista, Gregory J. and Frank X. Barron. 2003. Predicting creativity from early to late adulthood: Intellect, potential, and personality. Journal of Research in Personality 37:62-88.

144 Ibid.
adulthood and remained so in later maturity. For
the last several studies of the RCAC, artists have
exhibited high voter participation. Our study finds
that aging visual artists are no exception:

• Of 141 respondents, 87.9% voted in the last
  federal election
• 82.3% in the last state election
• 77.9% in the last local election
• Of 133, 82% are registered Democrats

These results are strikingly similar to earlier
RCAC studies with participation above 90% in all
the above election categories and 81.9% registered
Democrats. In fact, older voters are often looked
to by politicians to ‘swing’ a vote. For the Stanford-
Terman adults, religion was not very important
overall. For 127 artists, 85% felt no allegiance to a
religious affiliation.

COMMON MISPERCEPTIONS
ON AGING

In Rowe and Kahn’s landmark work on the
MacArthur Studies, Successful Aging, the authors
dealt with the common misperception that “to be old
is to be sick.” In fact, in 1994, 73% of Americans 75-
84 years old reported no disabilities and 40% of those
older than 80 were fully functional. Other common
ideas the authors noted are “You can’t teach an old
dog new tricks” and “The elderly don’t pull their own
weight.” While Rowe and Kahn provided evidence
to the contrary for these perceptions, our study
reinforces their view. Artists talked freely about what
they want to try in their art in the future and over
43.1% felt they had not yet made their best work.

Rowe and Kahn also dealt with the changing face
of retirement, citing that older adults increasingly
delay retirement, or if retired, choose to do volunteer
work. Over half (54.1%) of the University of Michigan
aging adults gave community service of less than
100 hours in the previous year; 28.8% gave over 100
hours. One-third of the 65-74 year old and 30%
of 75+ National Council on the Aging respondents
value new learning as a major contributor to vital
aging. Over half of aging visual artists volunteered
within the last 2 years. Also 68.3% of artists have
donated their art work or services in 2005.

Research has focused on creativity’s decline
as people age. While creativity and the creativity
practiced by artists are not necessarily the same,
artists have been identified by some as “more aware,
sensitive, and responsive to aging and death than
non-artists” and “more resistant to losses in creativity
with age than others. The resulting depression can
have a negative impact on late-life creativity as well
as physical and sensory losses. Depression, suicide
and other pathologies are invoked and mentioned
frequently in relation to artists. Nevertheless, our
data do not totally reinforce this view. Even though
RDS findings show a decline in productivity for some,
only about a quarter of aging visual artists say that in
relation to being an artist or to their work as an artist
they regularly experience depression and loneliness;
almost half experience anxiety but only 2.9% have
thoughts of suicide.

Thomas Dormandy, who looked at artists from
Tintoretto to Kandinski, expected artistic creativity
to decline with age and discusses the meaning of time
and continued learning:

…the learning of old artists was more often a
highly targeted, even obsessive, search for what
might prove useful to them in their craft…their
search for new and better ways of expressing
themselves remained intense.

This book presents findings from the MacArthur Foundation Study of Successful Aging, a long-term, multidisciplinary research program designed to examine the genetic, biomedical, behavioral and social factors of how we age. It is often referred to as the MacArthur Study.
150 Lindauer, 55, 57.
Willem de Kooning once recalled that when Titian was 90 years old, his arthritis was so severe he had assistants tie paintbrushes to his hands.

But he kept on painting Virgins in that luminous light, like he’d just heard about them… Those guys had everything in place, the Virgin and God and the technique, but they kept it up like they were still looking for something.152

MEETING BASIC NEEDS

We asked questions about artists’ ability to meet their basic needs. A total of 19.1% or fewer artists had their electricity or gas turned off, failed to meet a mortgage payment, needed to see a doctor or dentist but did not go or were without enough food to eat; of the general population of adults ages 60 years and older the percentage is 12.153

Perhaps counter-intuitively, U.S. census data show that the oldest age groups are able to meet their basic needs, even with low incomes. Although these findings are from the early 1990s, speculations to explain this pattern are relevant and include possible lower living standards when older people were young, especially for those who lived through the depression; lower expenses; a reluctance to admit their problems; or that they live in households with “stable and predictable circumstances” in terms of life changes, job changes, migration and budget.”154 In fact, nearly every difficulty was more common among children than among adults 60 and older.155

LIVING, WORKING, HOUSING, SPACE

In the world of work, there is often an assumption made that those who cease working lack attributes normally associated with occupations. According to Smelser and Erikson, crucial occupational conditions reveal a number of areas artists who operate as self-employed often avoid including bureaucratization, position in a supervisory hierarchy, routinization of work, frequency of time pressure and the risk of losing one’s job.156 While artists do understand self-discipline in relation to their work, these conditions are often the root of society’s difficulty in understanding artists. As a study in the early 1980s called Art Work quoted in its preface, “Oh, you are an artist. How nice. And do you also work?” 157

Over a quarter of aging visual artists want to reach a higher level of artistic expression/achievement as one of their top three artistic goals for the next 5 years, followed by increasing sales and number of works.

As evidenced by 67.4%, artists often live and work in the same space. The reality of “space” in New York City, where artists who own homes have a mean mortgage payment of $871 and a median of $1,000 a month (renters pay $839 and $800 a month respectively), is that many are the last to live in subsidized or rent-stabilized housing within the New York City. Forty-four percent of aging visual artists live in rent controlled apartments or residences.

Artists remain in New York City for a variety of reasons:

• 78.7% because of the city’s cultural activity
• 58.8% due to affordable living space
• 53.3% because of their network of peers
• 48.5% due to support systems for their art
• 44.5% because the city is a good place to exhibit/perform

As in other RCAC studies, artists are a stable population (one reason they are used to “gentrify” changing neighborhoods): 89.6% have lived at their current address for 10 years or more and the average number of years they have worked in their current

154 Ibid., 4.
155 Ibid.
county/borough is 31 years. (In our 1997 study, Information on Artists II, 87.5% of visual artists in 4 U.S. cities age 55 and over lived in the county of their current residence for 10 years or more.

**DISCRIMINATION**

In 1975, Dr. Robert N. Butler, Pulitzer-prize winning author for *Why Survive? Being Old in America*, coined the term ageism. He has been involved in defining, identifying and combating it ever since. Butler, also on the advisory board for this study, discusses personal, institutional, intentional and unintentional ageism. He defines ageism as discrimination in areas including health care, the workplace, elder abuse, nursing homes, emergency services, the workplace, the media, and marketing.\(^{158}\)

This study concentrates on several of these areas through the self-reporting of the interviewed artists.

In the Kessler et al. 1999 study of a nationally representative sample of 3,032 respondents ages 25-74, the authors state that “although more prevalent among people with disadvantaged social status, results show that perceived discrimination is common in the total population, with 33.5% of respondents in the total sample reporting exposure to major lifetime discrimination and 60.9% reporting exposure to day-to-day discrimination.”\(^{159}\)

Our data reflect a variety of kinds of discrimination against visual artists, 43.2% because of age, 41.7% due to gender, 27.7% based on artistic discipline, 21.2% based on race and 23% based on ethnicity. It is interesting that one-fourth of artists feel discriminated against due to their artistic discipline in addition to the more obvious kinds of social bias. In addition, 60.8% of the women said they felt discriminated against because of their gender (and 0% of the men!), and 52.1% of women and 27.5% of men felt discriminated against due to their age.

The study provides many anecdotal reports to validate its statistical findings. An artist we contacted to interview for the feasibility study prior to this report emailed:

> I never thought of myself as an ‘aging’ artist but I suppose technically you’re right—even though we’re all aging at the same rate. But I don’t use a walker, have a hearing aid or pacemaker. Yet. It has gone unnoticed that I was turned down for 23 grants in the last 10 years or so. I assume age was the reason because I don’t think it was the work.\(^{160}\)

A number of artists in our pre-survey focus groups and ongoing town meetings echoed the difficulty of being seriously considered for grants at their age, with very few public or private funding sources providing funds specifically to older artists (the Pollock-Krasner and a few other foundations being exceptions).

One 80-year old artist, among many, discussed being discriminated against because she is a woman. Trained to be a sculptor at the Beaux Arts in Paris and a member of the Haganah army in Israel, she was told by an art teacher “You’re gonna wind up in the kitchen anyway.”

Discrimination may be doubly painful for people from more traditional cultures that are seen as collectivist and value seniors. As in our study, a study of Canadian Chinese showed a high proportion who do not speak or understand English, creating significant barriers for involvement in their host country.\(^{161}\) Some artists of color said they had experienced racism but said it did not make their lives harder because they “didn’t have a choice.” Such rationales give support to continued discrimination.

In a ground-breaking exhibition of the work of aging artists in the late 1980s, ageism in America was expressed eloquently:

> Ageism is probably the deepest rooted and most collectively perceived bias in America. Like racism

---

\(^{158}\) Butler, Ageism in America.

\(^{160}\) Private email communication to Joan Jeffri. November 2006.

and sexism, it denies humanity its humanness…We face maturity with dread. As a society, we despise the old. Our misplaced pity erases the potential of the fastest growing and most experienced human force in the country.\footnote{Shedletsky, Stuart. 1987. \textit{Still Working: Underknown Artists of Age in America}. New York, NY: Parsons School of Design, 13.}

One-fourth of the artists said discrimination has affected their lives between some and a lot and 27% said discrimination has made life somewhat or a lot harder.

\section*{LEGACY PLANNING}

Visual artists are similar to the general population in their need and desire to preserve their property for the future, but they have a unique asset that many Americans do not: their art work.

Sixty-one percent aging visual artists have made no preparations for their artwork after their death. Only 10% have made plans to donate their work to an institution and 17.1% to leave work to their heirs. However, there is no certainty that these heirs want the work or know what to do with it. Twenty-seven percent of artists stated they need legal help bequeathing their work and planning their estates. One-quarter reported needing financial help in archiving their work; 40.6% said they cannot transport their own work to exhibitions and different spaces and 94.1% have no studio assistants.

Twenty-one percent artists have no documentation at all for their work. For artists, some of whom say they “want to go down in art history,” the lack of documentation will surely prevent this. One black painter keeps a log of works he has sold on a doodle pad marked with crayons. A 78-year old Puerto Rican photographer is now giving a great deal of attention to archiving and publishing his photographs. His dedication to preserving and organizing his portfolio of work was brought on by two separate events: the recent death of a colleague who left behind several thousand photographs that his family has no time to organize, and his own diminished eyesight, which forced him to stop taking photographs.

A whopping 97.1% have no estate plan and, while nationally only 44% have wills,\footnote{Thompson Findlaw. 2005. Eagen: MN., Retrieved December 20, 2006 (http://company.findlaw.com/pr/2005/051005.estateplan.html.) Sample size 1,000.} only 22.9% of artists do. Another 70.8% have no life insurance.

According to a 2004 survey by the Martindale-Hubbell Legal Network, 58% of adult Americans said they lacked a basic will, the fundamental component of any estate plan. Twenty-one percent said they were without an estate plan because they lacked sufficient assets.\footnote{Schmerl, Leah. 2004. “Many Americans Leave Loved Ones Vulnerable, Due to Lack of Estate Planning, New Survey Finds.” New York, NY: Lexis-Nexis Martindale-Hubbell, Retrieved December 20, 2006 (http://research.lawyers.com/Estate-Planning-Survey.html).} Nearly one-in-ten (8%) of those Americans without an estate plan say they do not have one because they do not want to think about dying or becoming incapacitated. Another survey by the American Association of Retired Persons (AARP) declares that the majority of Americans, 45%, do not have a will to specify the handling of their estate after they die.\footnote{AARP Research Group. 2000. “Where There is a Will…Legal Documents Among the 50+ Population: Findings from an AARP Survey.” AARP Program Development and Services: 2. Retrieved 3 June 2007 (http://www.aarp.org/research/reference/publicopinions/aresearch-import-424.html).}

Without legal documentation with instructions that will control one’s assets upon death, both the person and the artist’s assets are left vulnerable.

For artists, even those who have made plans, there are no guarantees that their work will reach its desired destination.

One artist told us that she felt artists face the same problems as everyone else in society with two differences: their need to keep a studio space

\begin{quote}
“I’m never going to retire from art so why plan ahead of time?”
—65-year old Hispanic new media artist
\end{quote}
as landlords raise prices and what to do with their artwork after they die. A 65-year-old painter burns a lot of his art every five years so his heirs will not be taxed on it. Another artist sold 5,000 of his works to his son for $1. Other artists use their work to barter: 8.1% of our survey respondents use their art this way.

THE CREATIVE PROCESS

Artists’ relationship to their art changes as they age. Artists’ personal well-being is also reflected in their relationship to their materials—51.4% said they use different materials, 37.8% use a wider variety of materials and 38.7% said they have more technical control of their materials than when they were younger.

Aging artists have remained vital within the art community. In the previous year:

- 26.8% participated in an art fair
- 28.5% in a group competition or exhibit
- 66.9% in a group invited exhibit
- 15.7% in juried community events and 24.2% in non-juried community events
- 27.3% in juried events
- 37.2% in 1-person exhibit

In 1975, Robert Butler spoke about one of the great losses of old age being the loss of choice which, when denied, promotes helplessness. Artists’ choices about what art to make, how to think about it and how to execute it create both self-respect and empowerment.

AGING ARTISTS’ NEEDS

In a conference call with a dozen gerontologists at the start of this study, one academic speculated that we would be studying “a bunch of failed artists.” Failure, in this person’s eyes, was a function of lack of income from art and the fact that this person probably would not have heard of any of these artists (although, in fact, we did interview some well-known artists). Of course, failure is subjective, but if we analyze these artists in terms we are all concerned with as we age—health status, engagement, productivity, savings for retirement—aging artists are far from failures.

There are, however, a number of real needs in addition to the needs we all have in aging. Clearly, most artists are dissatisfied with the money they earn from their art.

“Don’t make art bigger than your head because it’s harder to transport.”

—69-year-old male sculptor

Some, like the Asian artists we interviewed, do not know how to enter the marketplace or join a more mainstream kind of art system. Some speak no English, which makes this doubly difficult. Some face a dilemma of an East/West sensibility as practitioners of more traditional kinds of art such as calligraphy.

Some artists need studio assistants, framing services, technical support for the computer, discounts

---

166 Butler, Why Survive?, 230.
on art supplies, help with marketing and promotion of their work and grants (or at least those that do not eliminate them because of age). Some want to be able to work in a different scale and in different media.

All artists face both a financial and an emotional reality as they age: to whom will they leave their work and how will it be cared for? In one focus group, an artist told us he constantly “pruned” his own collection, destroying work he did not wish people to remember. Indeed, 68.1% of the artists surveyed have destroyed at least one piece of their own work. And while 20% have no documentation for their work—no photographs, archives, slides, or website, many of

the artists we interviewed indicated that they will not try to obtain these services from organizations. They would rather spend the time on the work itself.

The love-hate relationship so many have with New York is true for artists as well, but also coupled with the invisibility of age. One 72-year old female painter said: “When you’re young it’s important to be in New York. When you’re older, you can go wherever you want because no one cares about you anyway.” Nevertheless, the majority have lived in the New York City for more than 10 years and 87.1% say they do not plan to move out in the next two years.

One reason to stay in New York is the network of other artists. An 84-year old pen and ink artist, winner of a Fulbright and a Pollock-Krasner award, and facing the threat of eviction from his Lower Manhattan apartment, said: “I don’t want to leave New York. …I’ll be all alone and isolated.”

The bond to New York is not just a geographic one although 3/4 of artists said that the location of their artwork space is somewhat to very important to their art work. Artists in several of our focus groups lamented the change of the art environment in New York to one with lots of “fine art gimmicks” where what they called “bohemian loopholes” have been taken away. No doubt this includes things like illegal loft living.

SOME PUBLIC POLICY IMPLICATIONS

The social networks of aging visual artists provide a strong access point for policymakers. While the general population in nursing homes

---

declined substantially to 4.5% in 2000, none of our artists resided in nursing homes although we did find communities of artists in artists’ housing complexes like Westbeth.

The example of Westbeth is important for social as well as economic reasons. Founded in 1967 to provide living and studio space for middle-income artists who could not afford spiraling rents, it continues to house artists of all genres. More than just gentrifiers, artists can be seen as part of the glue that holds communities together.

Department of Cultural Affairs Commissioner Kate Levin stated at a 2002 conference at Columbia University:

...we can all anecdotally confirm...that neighborhoods tend to be revived initially and most substantially by the presence of cultural organizations, by the presence of artists, and by the kinds of neighborhood axes that arts groups provide in those neighborhoods...the arts should not be calibrated just in terms of the organizations that bring in big tourist bucks.168

Later at that same conference, Suri Duitch from Center for an Urban Future remarked:

There is a connection between the transforming power of art and the five-borough economic development strategy. ...There are a number of examples we can look to [she cites the BAM cultural district as one] that connect—on a very local level, on a neighborhood level—the transforming power of the arts to individuals, to communities, and that can also help to revitalize those communities economically without making it so that everyone who lived there to begin with has to leave because they can’t afford it anymore.169

The policy considerations for New York City include how to retain its intellectual and creative capital and how to create or enhance environments where artists retain strong social networks as they age. These considerations have grave implications for younger artists who also contribute to this capital.

“If you do away with art as a central concern, you kill its spirit, its soul.”

—77-year old male sculptor,
Art Students League

In terms of integration into existing systems, while 60% of the professional aging visual artist population have at least one retirement plan other than Social Security, only 52.9% of our Asian visual artists do. This has implications for policies dealing with immigrants, even those who have been here 20+ years and are highly educated. It also has implications for arts and cultural policy when such immigrant groups have a high degree of homophily (28.7% for Asians)170 and do not know how to enter or access the system of benefits (pension plans), the art market (selling their work), or artists services (archiving and documenting their work, estate plans).

This study fully documents artists’ engagement with their art and the power of their sustaining engagement: A 78-year-old male artist who suffered a stroke that left him crippled on the left side of his body and who spends most of his time in a wheelchair, paints every day. A 94-year-old we interviewed uses an office chair with wheels to scoot around his studio, thus avoiding the stigma of a wheelchair. An 82-year-old folk artist suffering from dementia said he needs art and music in his life to sustain him. A 72-year-old sculptor with synesthesia (a neurological condition in which 2 or more bodily senses are coupled, e.g. she “sees what she hears”) turned to painting to be able to illustrate her condition. Another artist has to paint

169 Ibid.
standing up even though the next day she cannot get out of bed. A male 82-year old still welds his art even with osteoporosis.

As Roberto Bedoya stated, “Cultural Policy in the U.S. context is best understood as a system of arrangements that effect the allocation of resources and the articulation of value.” He goes on to ask:

Whose voices are privileged or marginalized in policy discourse? …Are policy research efforts an exercise of self-aggrandizement that re-inscribes the power of special interest groups and policy making elites or are they a contribution to transformative learning that increases our knowledge of cultural dynamics and conditions?

Acknowledging the richness of the many voices Bedoya describes, aging artists of all races and ethnicities do not access many of the existing services available in the arts. Perhaps preferring to work on their art, they pose a dilemma for arts service organizations trying to assist them.

One policy argument and dilemma in making a case for artists is that it is economically and politically unsound to make many different policies for all special-interest groups. However, the aging artists we studied have a remarkably healthy profile, and should be seen as contributing greatly to the fabric of New York City. Their “life lessons” in engagement, in strong social networks, and in being motivated by a life of ideas can provide examples for other populations.

To the already disenfranchised minorities in the artist community, we can certainly add the soon-to-be majority of aging artists. It is our hope that these findings will help shape policy and practice by framing artists as beacons for the rest of society—not as its victims.

---

172 Ibid.
The structure of a community is defined by affiliation patterns, that is, the social relationships that link members of the community. These relationships vary in strength, from the extraordinarily strong bonds within families, to the weaker links connecting friends and acquaintances. The relationships of which social networks are composed are reciprocal, e.g., my family members consider me a family member, my friends and acquaintances consider me a friend or acquaintance. Merely knowing about people, such as Hollywood or political celebrities, does not make them a part of the social network. Therefore, social networks are made up of the social relationships that bind together families and communities.

Social relationships serve as conduits through which resources flow. These take many forms, from assistance when help is needed, to the exchange of pleasantries during informal interaction. For policy makers as well as scholars and observers, one indication of the resources potentially available to an individual is the number of others to whom that individual is linked. This defines the size of the individual’s personal network, and it serves as an indicator of social status. An indication of the cohesiveness of a community is the density of social ties within that network. The mean personal network size of community members also serves as an indicator of social capital. In our study of the networks of New York City metropolitan area aging visual artists, we found that the estimated mean personal network size in the population was 6. This means that the average visual artist aged 62 and above in the New York City area knows 6 other aging visual artists. In comparison, the average jazz musician in New York City knows 105 other jazz musicians. Part of this discrepancy is certainly due to the nature of the jazz performance world (i.e., musicians must play together, so they rely heavily on interpersonal contacts for professional success). In contrast, the creation of visual art can be accomplished in a solitary environment, if the artist so chooses. Because this study did not measure the total personal network size of aging artists (i.e., how many friends and acquaintances they have overall or how many visual artists they know who are younger than 62), the relatively small number of 6 does not indicate that these artists are without social capital and support. Rather, it indicates that aging artists receive social support from community members who are not also aging artists.

Social relationships can be structured in many different ways. Some communities are divided into independent and mutually isolated racial or ethnic groups. Described in Robert Putnam’s terms, these are communities based on bonding social capital, that is, group solidarity based on dense within-group social ties. Other communities are more integrated, with abundant cross group ties, or in Putnam’s terms, communities with bridging social capital. These structural features are important for understanding community dynamics. For example, when cross-group ties are sparse, the potential for conflict is great. Inequality also affects affiliation patterns. Some communities are highly stratified, with most interactions occurring among those of equal income, social status, and

---

education. Others are more egalitarian, with abundant cross-status ties.

Some social ties are based on similarity. This tendency of similar persons to form social bonds was described by Galton more than a century ago, and is termed homophily.\(^\text{174}\) Other bonds are based not on similarity but on difference. This is termed heterophily. Though opposites, homophily and heterophily can coexist. For example, aging artists may primarily form close friendships with those of the same gender (homophily) while primarily having more intimate relationships with those of the opposite gender (heterophily). Studying affiliation patterns provides a means for understanding both social differentiation (i.e., separate but equal), and social inequality (i.e., separate and unequal).

This section of the report focuses on affiliation patterns revealed by our Respondent-Driven Sampling (RDS) study of aging artists in the New York City metropolitan area. The aims are to determine the organizing principles of the community of aging artists, including an assessment of the extent to which these differ from those of other social groups.

**CREATING AN APPROPRIATE STUDY SAMPLE**

**Sample Characteristics vs. Population Estimates**

Because the difference between sample characteristics and population estimates can be confusing, it is important to consider the function RDS plays in the sampling of New York City aging artists.

If we could survey every single aging artist in the five boroughs, we could know for a fact the true population value(s) of any question we asked. Because this is either infeasible or impossible, we take a sample from the population and estimate the true population value from our sample data. The process of using sample data to estimate population values is called inference, and it is the reason many statistical procedures were invented.

As an example, if we wanted to know the proportion of different colored balls in a box containing 500 balls, we could note the color of all 500 balls and know the true population color proportions. However, if time does not permit an exhaustive enumeration, we can reach in, stir up the balls, and randomly choose a portion of balls. The color proportions from this sample would provide the basis for an estimate of the color distribution of the full population. Sampling of this type is called Simple Random Sampling (SRS) because we know every ball has an equal probability of being chosen for the sample.

In contrast, we know that “hidden” populations such as aging artists cannot be Simply Randomly Sampled because no exhaustive list of population members exists from which the sample could be drawn, and using a partial or incomplete list would mean we cannot locate many of them.

RDS accesses members of hidden populations through their social networks, employing a variant of a snowball or “chain-referral” approach. As in all such samples, the study begins with a set of initial respondents who serve as “seeds.” These then recruit their acquaintances, friends, or relatives who qualify for inclusion in the study to form the first “wave.” The first wave respondents then recruit the second wave, who in turn recruit the third wave, and so forth. The sample expands in this manner, growing wave by wave, in the manner of a snowball increasing in size as it rolls down a hill.

RDS then combines snowball sampling with a mathematical model that weights the sample to compensate for the fact that it was not obtained in a simple random way.\(^\text{175, 176}\) This procedure includes

---

controls for four biases that are inherent in any snowball sample:

(1) The seeds cannot be recruited randomly, because if that were possible, the population would not qualify as “hidden” in the first place. Generally, the seeds are respondents to whom researchers have easy access, a group that may not be representative of the full target population. Consequently, the seeds introduce an initial bias.

(2) Respondents recruit their acquaintances, friends, and family members, whom they tend to resemble in income, education, race/ethnicity, religion, and other factors. As noted above, this “homophily” principle was recognized by Galton more than a century ago. Its implication is that by recruiting those whom they know, respondents do not recruit randomly. Instead, recruitments are shaped by the social network connecting the target population. Consequently, successive waves of recruitment introduce further bias into the sample.

(3) Respondents who are well-connected tend to be over-sampled, because more recruitment paths lead to them. Therefore, higher status respondents—those who have larger social networks—are over-sampled.

(4) Population subgroups vary in how effectively they can recruit, so the sample reflects disproportionately the recruitment patterns of the most effective recruiters. For example, in AIDS prevention research, HIV positives generally recruit more effectively, and also tend to recruit other positives, so positives tend to be over-sampled.

Due to these potential sources of bias, RDS samples are generally not self-weighting. That is, the sample composition differs from the composition of the population from which the sample was drawn. Consequently, weighting of the sample is generally required, and the function of the statistical theory upon which RDS is based is to provide the means for generating those weights.

THE RESPONDENT-DRIVEN SAMPLING METHOD: ADVANTAGES AND CHALLENGES

This is the first time Respondent-Driven Sampling has been used to study visual artists. The recognition of this sampling method’s potential as a means for studying aging artists grew out of a successful study of jazz musicians in N.Y.C., San Francisco, Detroit and New Orleans. The RDS method has generally been used to study “hidden populations.” They are called this because 1) no list of population members (i.e., “sampling frame”) is available from which samples could be drawn, so the size, location, and boundaries of the population are unknown, 2) there are privacy concerns due to informal networks outsiders find hard to penetrate, and 3) the population is small relative to the general population. For nearly a decade RDS has been used as part of AIDS-prevention projects to study injection drug users and other groups at risk of HIV infection. The initial applications were in several small cities in Connecticut. It has now expanded to most major U.S. cities, Amsterdam, Marseilles, Russia, Vietnam, Thailand, and China. It has also been employed to study other groups, including Vietnam War-era draft resisters who left the U.S. for Canada, and urban Native Americans. The advantages of the RDS method become apparent when it is compared to more traditional ways hidden populations have been studied.

- General population surveys

A very large sample would be required to ensure that even a small number of aging visual artists were included in a general population survey. Additionally,

---

general population surveys are unable to reach those with unstable living arrangements (several non-relatives living in one apartment even though one name appears on the lease, for example).

- **Location Sampling**

Identifying locations where members of the desired population can be found and then deploying interviewers requires that the population cluster in large and public locations. For a group such as aging artists, this precludes a representative sample, because not all aging artists visit museums and galleries.

- **Institutional Samples**

This is the traditional method for studying artist populations, using institutions such as artists’ unions. However, aging artists lack any consistent institutional affiliation. For example, in New York City less than 5% of aging artists have ever been members of the Visual Artists and Galleries Association (VAGA). Furthermore, the two groups (members and non-members) are significantly different, for example, compared to non-VAGA members, members have substantially higher art income (106% more), are more likely to be married (71.4%, compared to 35.7% of non-members), and are less healthy (18% of non-members had excellent overall health, compared to 0% of VAGA members). Therefore, a sample drawn from VAGA members would over-represent the most accomplished aging artists, mischaracterizing the living situation of many aging artists and underestimating the health of the aging visual artist community.

Chain-referral sampling begins with a small number of initial subjects, called “seeds,” and the sample expands during subsequent referrals or recruitment waves. This has traditionally been viewed as a form of convenience sampling about which no claims of representativeness can be made, because when sampling from a hidden population the initial subjects cannot be selected randomly, and other biases are added as the sample expands from wave to wave, for example, individuals who know many other people (i.e., those with larger networks) tend to be oversampled, because the number of recruitment paths leading to them is greater.

The perception of chain-referral methods changed with the advent of a new class of sampling methods termed adaptive/link-tracing designs. Whereas in traditional approaches, the sampling plan is fixed before sampling begins, in adaptive sampling, the plan changes as information accumulates during the sampling process. These approaches are more computationally demanding than traditional methods, but they are also generally more efficient, especially for sampling clustered populations.

Respondent-Driven Sampling is a form of chain referral sampling that extends this emerging body of theory. It was designed using a statistical theory of the chain-referral sampling process to restructure the sampling process to eliminate biases resulting from the choice of initial subjects, and to weight the sample to compensate for the effects of differences in network sizes and other sources of bias. In this way, RDS produces statistically valid estimates of population size and network characteristics from samples of hidden populations, including estimates of the variability of these estimates.\(^\text{180}\)

**CONDITIONS**

For RDS to work effectively, the population under study must be linked by a contact pattern, so members of the community under study must know one another. Aging artists fulfill this requirement both because art markets are driven by inter-artist contacts and artists generally require the empathy of other creative persons/artists for emotional support and strong friendship bonds. Since the method is based on

a peer-referral system in which modest incentives are used for the redemption of a series of coupons, great importance is placed on motivating peer recruitment.

In this study each artist who was interviewed was given four coupons to pass along to fellow aging artists to recruit them for interviews; the recruiter was given $25 for his or her interview, and $15 each for up to four interviewees s/he recruited. Interviews were conducted in English, Spanish, and Chinese.

**Advantages**

In addition to targeting a more representative group of aging artists than traditional methods allow, RDS is a community-based method which requires aging artists to refer each other—thus avoiding a sample filled with the most marketable, the most famous, the most vocal aging artists or only those who join particular organizations.

The RDS method allows us to analyze the social networks of aging artists, including the degree to which this depends on race/ethnicity, artistic medium or other factors.

**Implementation Issues and Challenges**

Staff at Columbia’s Research Center for Arts and Culture ran the project in four of New York’s five boroughs.\(^1\) Ten well-connected aging artists or “seeds” were invited to start the process by being interviewed, being told in detail about the project, and being enlisted to distribute four coupons.

---

\(^1\) While some general comments apply to professional artists in all the boroughs, we were unable to interview artists who reside in Staten Island and hope to do so in future. Two of the original sample were later found to be under 62 at the time of their interviews and are not counted in these results.
Contact Pattern and Use of Coupons

Generally in RDS studies, it takes only four or fewer waves of recruitment to reach deep into the community and for the sample composition to become stable. This point at which the sample composition remains the same from wave to wave is termed the “equilibrium.” However, when the population is made up of highly cohesive sub-groups, recruitment chains have difficulty crossing group boundaries, so more waves may be required for equilibrium to be reached. This was a special problem in our study of aging artists, who comprise a relatively fragmented community. The New York aging artist social network has important boundaries across races; specifically, Chinese members of the community are highly cohesive and insular. One recruitment chain was comprised of exclusively Chinese artists, with 86% of the chain being female and 70% residing in Queens (there is a vibrant “Chinatown” in Flushing, Queens). In addition, many aging artists neglected to pass out coupons, especially across racial groups. Due to this structural segmentation, it took significantly longer for the bias due to non-random seed selection to be eliminated. Simulations estimate that it would take 11 recruitment waves to eliminate the bias due to race if sampling started with a white seed, a figure that corresponds to the number of waves in the longest recruitment chain.182

As the study neared its conclusion, it was recognized that cross-race recruitment was rare. One approach to increase cross-race recruitment would have been to introduce “steering incentives,” in which these recruitments are especially heavily rewarded. However, that would violate the random recruitment assumption underlying RDS theory, in which respondents are assumed to recruit randomly from their personal networks. Consequently, a two-stage sampling approach was used. This approach has been successfully used in previous RDS studies, and involves allowing recruitment to proceed as normal until the desired sample size is almost reached. At this point respondents who have already recruited those of special interest to the researchers are given additional coupons with which to recruit. While all of these coupons will not go to the desired sub-group(s), this approach successfully increases the representation of groups of interest without violating the assumptions which must be met for researchers to have confidence in RDS population estimates.183

Given the demands on artists’ time and the special nature of studying an aging population (e.g., higher likelihood of survey fatigue), motivating peer recruitment also proved challenging. Coordinating staff enlisted the help of aging artists in “talking up” the study to increase community motivation. However, it took a total of 16 months to recruit a sample of 215 aging visual artists, far longer than most RDS studies. These issues illustrate the importance of community acceptance and respondent motivation for a peer-recruitment-based method to be effective.

Location and Transportation

Because there were concerns about some aging artists’ mobility, interviewers were highly flexible about interview locations. Some respondents elected to meet interviewers in a public location (e.g., a Columbia University cafeteria, a borough arts council), but the interviewers traveled to the homes or studios of most respondents.

Scheduling

The coupons that respondents recruited with had the study’s phone number printed on them, and respondents would call to arrange a location and time for the interview. Although some respondents canceled or did not show up to appointments, the proportion was in line with past RDS studies, and it was not a major problem.

---

182 All facts and figures in this chapter are based on analyses of the full sample of 213 aging artists. When the sample has been disaggregated by professional artist status, it is noted in the tables.
• Incentives

The financial incentives were extremely modest. As noted above, for his own interview and the redeemed coupons of artists he recruited, an artist could make up to $85, $25 for the interview and $15 each for up to four recruits. The incentives were important as a token appreciation, but we realized they were just a token. Approximately halfway through the study, it was decided that the monetary recruitment incentives were insufficient to motivate some recruiters. In response, staff solicited donations from local arts businesses to create a voucher booklet entitled the “Artists’ Pass.” Unfortunately, there was not a significant increase in recruitment effort after the introduction of the Artists’ Pass. It is not clear what would have motivated New York aging visual artists to be active in the study, but we suspect that professional performing artists who are represented by unions and who often work collectively might prove easier to recruit. Whether older respondents are able to be motivated enough for chain-referral sampling to proceed efficiently and quickly is an issue worth further investigation.

• Recruitment Effort

Given the issues this study had with motivating aging visual artists to recruit others, it is instructive to examine different determinants of recruitment effort. As has been the case in many RDS studies, recruitment effort has a moderate negative relationship to respondent income. It makes sense that respondents who are well off would not be motivated by the modest recruitment incentives offered for participation. However, art income is positively related to recruitment effort, showing that respondents who were highly active in the arts community were more motivated to recruit than those who were less involved. This relationship could indicate the success the study had in motivating respondents through altruistic motives (i.e., respondents more integrated into the community were motivated by the recognition that this study will inform policy that assists New York aging artists).

In this study, there was a negative relationship between age and recruitment effectiveness. Because mobility decreases with age, older respondents had a more difficult time accessing their friends and acquaintances in the aging artist community than did younger respondents in the jazz study, for example. In addition, there is a slight positive relationship between respondent health and recruitment effort, primarily driven by the difficulties respondents with “poor” health had recruiting. Expectedly, there was no relationship between personal network size and recruitment effort. In the past, a correlation between these two variables would induce slight bias into population estimates, so RDS was specifically designed to prevent this relationship from forming by limiting the number of recruitments each respondent can make. However, recent theoretical advancements in RDS theory have eliminated this source of bias, so the strict coupon limit can be slightly relaxed and still generate valid population estimates.

• Management of the Project

Before the interviews began, the study coordinator was intensively trained to learn the method, master the necessary computer programs, and ask questions. The project was management-heavy, partly because this was a first-time methodology for aging artists, but also because it required separate checking accounts and tracking for coupons, constant scheduling and re-scheduling of interviews in several languages, and substantial outreach.

• Responses

The initial plan for the study was to interview 300 aging artists in one year. Due to the difficulties in motivating respondents to recruit, the study period was extended to allow a larger sample size to be reached. Unfortunately, the original target sample size could not be met due to time and money constraints.

184 This is expected to be the population for the next phase of the Research Center’s investigation of aging artists.
This chapter on aging artist networks is based on 213 interviews with New York aging visual artists collected from April 2005 to May 2007. We have used the full sample in order to analyze the network relationships among all respondents, but have also included comparisons between the professional and non-professional artist populations. The remainder of the chapters in this report focuses on the 146 professional artists.

**STUDY SAMPLE CHARACTERISTICS**

Table I displays the demographic characteristics of the full sample. The vast majority of sample members lived in Manhattan, with the next most represented borough being Queens. Most of the Manhattan residents were white, Brooklyn residents were evenly black and white, and Queens residents were predominately Asian. The sample contained 61.5% females—the combination of higher recruitment effort by females and larger average network sizes led to the sample proportion being higher than the estimated population proportion (see below). Approximately 67% of the sample was white, followed by 16% Asian, and 12% black. Half of the sample was painters, followed by mixed-media artists, sculptors, and “Other” types of artists. A large majority of the sample considered themselves professional artists (73.4%). About 62% of

the sample graduated from college. The mean age of the sample was 73.72, with the youngest respondent aged 62 and the oldest 97. The distribution of income from art was highly positively skewed, with the majority of respondents making less than $2,000 per year and a very small number making greater than $20,000. The skew is indicated by a mean value for income from art ($5,850) that exceeds the median ($1,750) by a factor of more than three. Household income was less skewed, with a mean around $50,000 and a median of $30,000, and the mean exceeded the median by a factor of less than two. The distribution of personal network sizes was also highly positively skewed, with a mean of 28.54 and a median of 10.

Demographics

• Comparing Professional and Non-Professional Artists

There are important demographic differences between the professional aging artists in the sample and the non-professional aging artists. This section examines those differences by comparing RDS population estimates (not sample characteristics).

The geographic distributions of professional and non-professional artists are similar to the extent that the majority of respondents live in Manhattan. However, the percentage of professional artists residing in Manhattan is 22.9% higher than for non-professional artists. The non-professional artists show slightly greater presence in Brooklyn and the Bronx, but they show a 19.1% greater proportion in Queens. There is a slightly higher proportion of female professional artists than males, and a slightly higher proportion of male non-professional artists than females.

Professional artists have a much higher proportion of white respondents in the population, 74.5%, versus non-professional, who are 45% white. There are a slightly larger proportion of blacks in the non-professional group, and a significantly larger% of Asians. Professional artists have a slightly higher proportion of college graduates than do non-professional artists (62.5% and 60.7%, respectively), but the distributions are very close.

As is expected because of decreasing professional activity, the mean age of non-professional artists in the sample is four years higher than that of professional artists. Also expectedly, professional artists’ gross income from art for the year 2005 is $4,709 greater than that for non-professional artists. Individual income is fairly even, with professional artists having a slightly higher mean (a difference of $586). Additionally, professional artists have moderately higher household income than non-professionals (a difference of $3,932). Finally, professional artists have a slightly higher but much more variant average network size, reflecting the extreme connectedness of some professional artists.

• Differentiation and Stratification in Aging Visual Artist Networks

Network size has been intensively studied because it serves as an indicator for individual characteristics, including social status, prestige, and integration into the community. Therefore, examining clustering by network size provides a sense for the overall structure of that community.

The measure for network clustering, homophily, is defined as follows. The homophily index is positive when social relationships within the group are favored. For example, it is +100% if all ties are within the group, so clustering is maximal, and an index of 50% means that 50% of ties are formed within the group, and the other 50% are formed through random mixing, that is, ties form as though group membership does not matter. A positive index value indicates that the group is cohesive as defined by a preference for affiliating with in-group members. Factors such as race, ethnicity, education, income, and age generally serve as important sources of cohesion. In this study we determine the extent to which each of these is the case for aging visual artists.

The index is zero for categories that are socially irrelevant, such as whether one was born in an odd or an even month. With respect to such categories, social ties are formed exclusively through random mixing. Therefore, zero index values serve to identify a factor that the community does not consider to be relevant.

The homophily index is negative if ties tend to form with those outside rather than inside the group, as, for example, sexual relationships among heterosexuals. The index is (-100%) if all ties are outside the group, so there are no within-group ties.

The analyses of clustering by network size reported in Table III reveal a distinctive pattern. Respondents were divided into four groups, based on network sizes. A “small” network is defined as sizes 1 to 5, a “medium” network as 6 to 12, a “large” network as 13 to 25, and a “very large” network as 26 to 600. As the table indicates, the vast majority of respondents had network sizes of 1 to 5, which is one reason why the sample took so long to gather. It is extremely unlikely that a respondent with a total aging artists network size less than five would recruit four respondents (the number of coupons given to each recruiter).

### Table III: Affiliation by Network Size

<tr>
<td>Very Large</td>
<td>29.1</td>
<td>58</td>
<td>2.3</td>
</tr>
</tbody>
</table>

Table III shows that network size strongly affects affiliation. In New York, those with very-large networks are the most homophilous, forming networks as though 29.1% of the time they form a tie to another very-large network person, and the rest of the time they form ties through random mixing. The large network persons are less homophilous, and the medium network persons even less homophilous (though still high enough to be socially significant).

The large group with the smallest networks have strong heterophil, forming ties as though 40.3% of the time they form a tie outside their group and the rest of the time they form ties randomly. Thus, those with smaller networks do not associate primarily with one another, but rather they form ties to those with larger networks.

A more refined examination of the community structure involves examining not merely each group’s strength of affiliation to itself (i.e., homophily) but each group’s strength of affiliation to each other group. In essence, the affiliation index is a measure of social distance that varies from 100, maximally close, to (-100), maximally distant. (See Table IV.)

Although the small-network group is strongly heterophilous (-40.3%), it has a small positive affiliation to the medium network group (3.2%) and a moderate affiliation to the large network group. The small network group has the strongest positive affiliation to the very-large network group (17.1%). Thus, those with small networks affiliate as though their principal orientation is toward forming ties with those having the largest networks of all aging artists.

### Table IV: Affiliation Index by Network Size

<table>
<thead>

<td>Medium</td>
<td>-66.1</td>
</tr>
<tr>
<td>Large</td>
<td>-67.1</td>
</tr>
<tr>
<td>Very Large</td>
<td>-65.3</td>
</tr>
</tbody>
</table>

The affiliation pattern of the medium network group is different. It affiliates most strongly toward itself (21.3%), and more weakly to the large and very large network groups (16.6 and 16.8%, respectively), and it is strongly negatively affiliated toward those with small networks (-66.1%). Thus, the affiliation patterns of the small and middle network groups are inconsistent, with the small network group
affiliating with those of the highest network sizes and the middle network group primarily associating with itself.

The large network group has substantial self-affiliation or homophily (23.8%) and almost equal affiliation with the very-large network group, with a very moderate affiliation to the middle group (7%) and a very strong negative affiliation toward the small network group (-66.7). Finally, the very-large network group has very strong homophily, a more moderate but strong affiliation with the large network group, a very weak affiliation with the medium network group, and a powerful negative affiliation with the small network group.

This may reflect a process in which the poorly-connected majority of aging artists seek ties with those who are better connected, seeking to avoid others who are poorly connected and having moderate success in forming ties to the most well-connected peers. The middle network group exhibits a similar orientation toward the large and very-large network groups, but shows moderate cohesion as an independent subgroup. The affiliation patterns of the large and very-large network groups indicate that they are well-connected to each other. In aggregate, these patterns represent a system in which there is a relatively small group of well-connected artists, with a larger medium-connected group on the margin, and the vast majority of artists on the extreme periphery. This reflects the social landscape of the art world, in which the most successful and best connected artists serve as hubs with spokes radiating out to the less successful and less well connected.

However, it is important to note that this is probably not a network structure driven by the professional success of those with the largest networks. In fact, the bivariate correlation between network size and art income is .094, meaning that we cannot reliably say the relationship is not due to chance. However, there is a moderate correlation between hours per week spent making art and network size, indicating that engagement in the process of making art is positively related to being well-connected in the aging artist community. Additionally, there is a moderate negative relationship between age and network size, indicating that people tend to disengage in the artist community as they age.

These patterns suggest a system in which most people gradually lose connections to the artist community as they age. For some artists, this may reflect retirement from another full-time occupation. For others the determination to focus on their work as their personal and physical resources diminish may create further isolation.

However, a small proportion of aging artists continues to be highly involved in the community, keeping many, if not hundreds, of ties active. The positive affiliation from the small network group to the very large network group indicates that, although connections are lost as time passes for most artists, even those with personal network sizes less than five might know someone who is very well connected, with a personal network size in the hundreds.

</tr>
</tbody>
</table>

When affiliation by network size is disaggregated by professional artist status, it becomes clear that the patterns observed above are largely driven by professional artists’ affiliation patterns. Although the values are more modest, the overall homophily trends are identical for professional artists. These trends are consistent with less well-connected professional artists.
seeking ties with better-connected professional artists to increase their ability to tap into the art market.

In contrast, non-professional artists’ homophily trends are markedly different from aggregate homophily trends. Small and medium network size artists show mild homophily, large network size artists show strong homophily, and very-large network artists show moderate homophily. This pattern is consistent with friend networks, where a subset of the population (the “popular” crowd) is very well-connected, while most people have a smaller number of friends who tend to be similar in social status.

Overall, this type of social system is indicative of a relatively egalitarian community. It differs greatly from a caste system, in which cross-status ties are infrequent. In contrast, this structure has an egalitarian character, because those with small network sizes are not structurally segregated from those with larger network sizes. This may be one of the reasons for the mix of professionals and non-professionals in the study. In comparison with many other social characteristics that influence affiliation patterns, this represents an unusual degree of egalitarianism.

Affiliation by Demographic Factors

Overall in U.S. society, level of education is strongly correlated with social status and income, so it serves as a strong determinant of affiliation patterns. Typically, one would see moderate to strong positive homophily for each educational group. Such is not the case in the New York City aging artist community. When respondents were divided into two groups, college graduates (64.4% of the population) and non-college graduates (35.6% of the population), education was found to have no significant effect on homophily for graduates and a moderate effect on homophily for non-graduates. (See Table VI.)

The homophily levels for college graduates and non-graduates were 4.3% and 18.7%, respectively. This means that college graduates formed their social networks as though 4.3% of the time they sought out a non-college graduate, and the other 95.7% they formed a tie irrespective of education level, so education had almost no effect on affiliation. In contrast, non-graduates formed networks as though 19.2% of the time they formed a tie to another non-college graduate, and the other 80.8% of the time they formed a tie irrespective of education. Therefore, level of education was more relevant for respondents without college degrees.

For the analysis of affiliation by race and ethnicity, respondents were divided into four categories, White, Black/African-American, Hispanic, and Asian. In
New York, race and ethnicity have an extremely powerful effect on affiliation, with homophily levels of 54.9% for blacks, 72.7% for whites, 11.4% for Hispanics, and 78.5% for Asians. Racial homophily this high is not typical of RDS studies. For example, in a study of network structure in several small cities in Connecticut, homophily levels for whites varied from 27% to 37%, with a median of 36%, and for blacks they varied from 30% to 50%.

When affiliation by race and ethnicity is examined (see Table VII), it is clear that all races/ethnicities except Hispanic had few cross-race ties with other races/ethnicities. Black artists infrequently had ties to white artists, and they are almost fully segregated from interaction with Asian artists. White artists display a similar lack of ties with black artists as blacks toward whites; they also show very few ties with Asian artists. However, black artists affiliate as if race does not exist toward Hispanic artists. As is clear from the table, Asian artists exhibit the strongest patterns of isolation from other races. In addition to having very few ties with black and white artists, they also have relatively few ties to Hispanic artists. Finally, Hispanic artists display the most neutral affiliation with respect to race in the sample. They affiliate as if race does not matter toward black and white artists and have few ties to Asian artists.

One element of this segregation is due to geography. The segment of this sample that resides in Manhattan is 79.2% White; 9.7% Black; 5.2% Hispanic; and 5.2% Asian. In Brooklyn, 44% of the sample is black and 44% are white. Queens is 63.9% Asian and 30.6% white. (As noted above, one recruitment chain was comprised exclusively of Asians, the majority of whom resided in Queens.) Finally, the aging artists sample from the Bronx is evenly black, white, and Asian. This illustrates the strong relationship between geographic/residential segregation and racial affiliation patterns.

Gender is also a significant factor affecting affiliation among aging artists. In New York, homophily levels are 51.8% for female artists, and 23.5% for male artists. This pattern indicates that aging artists form cohesive sub-groups along gender lines, with gender being a more important influence on affiliation for females than for males.

Age has complex effects on affiliation among aging artists. We divided the sample into four groups, aged 62 to 67, 68 to 73, 74 to 79, and 80 to 97. Artists in the youngest, second youngest, and oldest groups exhibited similar homophily levels between 20 and 25%. This is consistent with a cohort structure, in which individuals associate with those of similar age. However, artists aged 74 to 79 exhibited mild heterophily of -5.6%. This anomalous group does not conform to a clear affiliation trend (potentially due to small sample size).

When homophily is compared across professional artist status, some interesting trends are revealed (see Table VIII). For example, in contrast to the aggregate affiliation patterns, education is a fairly strong determinant of affiliation when the sample is disaggregated. The observed patterns of positive homophily for both graduates and non-graduates is consistent with the standard “cohort” structure where the population divides itself into two distinct groups. Homophily for professional artist college graduates is similar to that for non-professionals, but homophily for non-professional non-graduates is half that of professional non-graduates.

Homophily by race is generally greater for non-professional artists than for professionals. This is consistent with racial homophily in the general population, because people cluster quite strongly
with those of the same race. In contrast, race does not play as large a role in affiliation for professional artists, because being a professional artist is a master identity that transcends race. Professional artists interact with one another not as members of a race, but principally as artists.

Professional artists’ homophily by age shows a clear trend of older respondents’ affiliation patterns being less affected by age than younger respondents. This is probably an indicator of the need for more active professional artists to rely on each other for connections to the art world. For non-professional artists, we see more consistent positive homophily, similar to the general population’s tendency to cluster by age.

By borough, professional artists who reside in Manhattan show very strong homophily; this reflects Manhattan’s position as the preferred location for the most active and successful artists. Because geography is such an important determinant of whom people interact with, we would expect homophily by borough to be high and relatively uniform for the general population. Non-professional artists conform to this trend.

These patterns reveal that professional artists have distinctly different network structures than non-professional artists. In the former, affiliation is primarily organized around participation in the artistic community. In the latter, network structures are more similar to the general population.

• Income and Affiliation

Income is a variable that generally has powerful effects on affiliation patterns, with individuals associating primarily with those within their own income category. However, among aging artists the pattern is different. First, consider income derived from art (excluding teaching). Respondents were divided into four income groups, based on whether they earned: $0, $1 to $500, $501 to $7,000, or more than $7,000 from art. (See Table IX.)
Consistent with expectations, homophily for the highest income group is moderately high and positive, 19.7%. However, contrary to the usual pattern, those who make no money at all from art are not homophilous, instead they are heterophilous, -26%. Therefore, the lowest income group orients not toward its own members, but rather to the higher income groups (equally to the second lowest and highest income group). The $1 to $500 group is fairly homophilous, 14.8%, and the $501 to $7,000 is very mildly homophilous, 2.3%. These patterns indicate that those with low (but not $0) art income form a cohesive group, possibly retired or part-time artists who simply enjoy making art.

Individual gross income from 2005 was also divided into four groups: $0 to $12,000, $12,001 to $20,000, $20,001 to $40,000, and more than $40,000. Surprisingly, no group shows significant homophily, and the only one with moderate homophily is the lowest group. However, the second lowest group shows strong heterophily, which means they prefer to associate with groups other than their own. The affiliation matrix indicates that the top two income groups form a relatively cohesive unit; the $12,001 to $20,000 group shows modest positive affiliation toward the top group, and the lowest income group shows negative affiliation toward the middle two groups and neutrality toward the top group. It is probable that artists display mild preferences based on individual income because household income generally determines standard of living, conspicuous consumption, and income-derived status (see below).

</tr>
</tbody>
</table>

Total household gross income for aging artists was also divided into four groups: $0 to $12,000, $12,001 to $40,000, $40,001 to $75,000, and more than $75,000. As is expected, the highest income group shows a strong in-group preference, with homophily equal to 43.7%. There were not enough members of the $40,001 to $75,000 income group, which comprises 11.7% of the aging artist population, to produce stable homophily estimates. The affiliation index (see Table X) indicates that this income group shows moderate negative affiliation towards the lowest income group and strong negative affiliation with the highest income group. However, they show strong preference for the $12,001 to $40,000
income group. The $12,001 to $40,000 group more moderately reciprocates this preference, indicating that the two middle income groups form a cohesive sub-group. This could be indicative of an aging artist “middle class” that does not frequently interact with the lowest or highest income households. The lowest income group displays moderate negative affiliation toward the $12,001 to $40,000 group and behaves as if household income is irrelevant toward themselves and the upper two income groups.

Professional artists’ affiliation by art income illustrates the way more successful artists cluster together to sustain the networks through which the art market operates. The highest professional artist art income group shows strong positive homophily; however, the second highest income group shows strong heterophily. The affiliation matrix reveals that those in the second highest group affiliate strongly toward the upper group. This is consistent with moderately successful professional artists pushing to make contacts with the most successful and well-connected artists.

Homophily patterns by individual income illustrate the similarity of non-professional artists to the general population. As noted above, income is usually a powerful determinant of affiliation, and this pattern is observed in non-professional artists’ network structure. While the data were too sparse to estimate homophily for the highest individual income group, homophily is high and positive for each of the three other groups, indicating that they form cohesive sub-groups within the population.

In general, the household income data indicate that those with the highest household incomes are significantly more homophilous than those in other income groups. This is inconsistent with patterns of affiliation for the general population, where income groups display uniform, positive, and strong homophily. It is not clear why this is the case, but the patterns do reveal that income affects affiliation more for higher income respondents.

These data reveal the complex ways in which aging artists organize themselves by income. Art income illuminates the divergence between aging artists who enjoy making art primarily as a hobby and those still active in professional artist circles. Individual income does not seem to have much import to the aging artist community. Finally, household income displays the moderately cohesive aging artist “middle class”, but overall illustrates the egalitarian nature of all aging artists except for those with the highest income. Overall, aging artists in New York show much less segregation by income than the rest of the United States.

### Affiliation by Professional Activity

Affiliation is also affected by the level of artistic and professional activity (See Table XII). Affiliation by artistic and professional activity suggests that active
professional artists and non-professional artists both form cohesive groups. Homophily by professional status (which is self-identified by personal definition but also by other criteria including the body of work, record of exhibitions, the amount of time spent and formal education) is strong, 50.3% for professionals and 41.2% for non-professionals.

</table>

In sum, the aging artist community shows moderate regard for artistic income as a determinant of affiliation patterns, but this divide is mostly due to differences in activity and professional involvement. In addition, the relationship between age and artistic activity is significant and strong, with a bivariate correlation of -0.31 (p<.01). Thus, it is clear that, in general, artists gradually decline in artistic productivity as they age, reflected in the two cohesive groups of active professional artists and non-professional artists.

### Affiliation by Engagement

When affiliation by engagement is examined, the divide between more and less active artists becomes apparent. Having participated in any of the eight events the survey asked about (art fairs, group competition exhibits, group invited exhibits, juried community events, juried events, one-person exhibits, non-juried community events, and “Other” events) is a basis for moderate to strong homophily. Not surprisingly, non-juried community events provide the least impetus for differential affiliation because they are more accessible.
Contrastingly, the highly successful artists who have had one-person exhibits show strong homophily, and those who have not had a one-person exhibit show mild heterophily. This pattern is consistent with less successful artists preferring to associate with more successful artists to gain access to the networks that underlie the art market.

Affiliation by Medium of Art

The effect of medium of art on affiliation patterns is moderate and in general slightly weaker than factors associated with professional activity. Table XIV shows homophily, network sizes, and population estimates for the seven most popular visual arts media in the sample (with the other seven smaller media classified as “Other”). Those who work in a specific medium are generally more homophilous than those who do not, because working in a medium is a basis for affiliation, whereas those who do not work in a specific medium are a heterogeneous mix of other media. Homophily by artistic medium varies from a mild 3% for graphic artists to a fairly strong 24.9% for sculptors and 24.5% for multi-media artists. The other two categories with moderate homophily are drawing (12%) and photography (11.8%). Thus, there is considerable variation across media regarding how important artistic medium is to affiliation patterns.

As the table indicates, more than half of aging artists are painters. Painters display mild homophily, indicating that artistic medium does not have a large effect on their affiliation patterns. In contrast, both mixed-media artists and sculptors show strong positive homophily. “Other” artists show powerful heterophily. The in-person interviews indicated that, especially as artists’ age, they may change their medium, possibly for physical reasons. Past RCAC studies have also shown that many artists work in more than one medium even though they self-identify in one.

</tbody>
</table>

In general, artistic medium has mild but highly variant effects on affiliation patterns. There is no relationship between a medium’s popularity and affiliation, indicating that this is not a social landscape where those in less popular media are pushed aside for the most popular.

**CONCLUSION**

This analysis reveals the complex ways in which aging artists organize themselves. It examines affiliation patterns by demographics, income, professional activity, artistic engagement, and artistic medium.

Overall, it is clear that both professional and non-professional artists become less active in the arts community as they age. They show much less segregation by income than the rest of the country and, except for those with the highest income, have a highly egalitarian nature. While professional artists primarily affiliate based on their engagement in the professional art world, non-professional artists (while still oriented toward artistic creation) exhibit network structures more similar to those of the general population.

These patterns depict a population of aging artists whose contacts are in many ways bound to the geographic composition of New York City, but, in spite of this, still comprise a vibrant community of considerable strength.
CHAPTER IV
Conclusions and Recommendations

Psychological models of “successful aging” have highlighted evidence of positive personal growth, creativity, self-efficacy, autonomy, independence, effective coping strategies, sense of purpose, self-acceptance and self-worth.\footnote{186} Artists, as our study makes abundantly clear, are engaged in all of these indicators, especially with their art as a barometer.

The following section provides recommendations, including artists’ own suggestions, to broaden policy issues and illustrate some of the successful practices as models for the rest of society. It is not comprehensive. In fact, the more we speak with the artists themselves, the more ideas take shape. Rather than make artists yet another special interest group, this section delineates ideas to translate to the larger society, as well as recommendations specifically for artists. Since aging is inevitable for us all, we hope our study can contribute to the serious, ongoing discussions both by agencies that have been invested in issues of aging as well as newly involved organizations and individuals.

REDEFINITIONS

1. Redefine both “work” and “old age.”

   The workplace is changing radically with 10 million self-employed workers in the United States (over half of artists and related workers in New York City are self-employed) and with major changes in the increasing number and presence of women in the workplace and the nature of work itself (the ubiquitousness of technology, concepts of flextime, early retirement, etc.) Both work and the workplace are undergoing examination. For aging visual artists and many others, “work” does not stop in the studio; it is an ongoing process, misunderstood by a society hungry for numerical measures and finished products. This type of engagement illustrates more flexible employment that provides choice, control and independence for older individuals. In addition to increasing employment satisfaction and engagement, benefits include possible reductions in welfare spending, increased income tax revenue, more experienced workers and a kind of “social inclusion” in the marketplace—all this in addition to harnessing the talents of an ageing workforce.\footnote{187}

   The generally accepted categories of aging—the old, the old-older and the old-oldest, are also likely to change as the lifespan lengthens and a growing percentage of people stay out of nursing homes. Age has become only partly a function of chronology. For visual artists, age can also mean maturity of their work, new concepts and materials, and experimentation free of the risk of being young, all characteristics that might be applied to other segments of society.

SOCIAL CARE

2. Create support for informal social care using the networks provided by artists to each other as a model. By nurturing the strong community networks of artists and other groups, community-based health programs and strengthened social networks may prevent premature institutionalization.

   Aging artists communicate very frequently with

\footnote{186}{Bowling, 263-297}
each other although most are not in communal living situations. Agencies involved in the social care and support networks of the aging might look to artists to understand better how their social networks provide needed support. In some areas like race, artists have created somewhat isolated enclaves, and with some immigrant populations, lack of skills in English increases this isolation. Yet, artists communicate frequently within their own networks and many are loathe to seek assistance outside them, reserving the energy they have for their art work. Social and arts service agencies can use this group to develop strategies of communication in order to serve them.

The children and heirs of the baby boomers should be interested in this as well, as the emotional, physical and material requirements for caring for their aging parents becomes a reality.

RETIREE

“I’ll retire when I’m in my coffin.”  
—Jewelry designer, age 69

3. Investigate more flexible models of retirement benefits that allow for multiple jobs and careers, freelance work, productivity outside the normal 9-to-5 workday and mechanisms for retirement savings earlier in life.

Retirement plans such as pensions only gained currency in the U.S. in 1935, later than many other countries with more advanced systems of social benefits. The mandatory retirement age changed in the U.S. from 65 years old to 70 years old to being eliminated, but ambivalence continues about aging and about how our society takes care of its growing and increasingly elderly population. The non-traditional careers of artists and other freelancers beg for a new understanding of both retirement and the benefits that situation confers. This may require modification of national and state laws to provide benefits for non-traditional employees.

More than 70% of older workers in the United States have some type of retirement plan coverage. However, this means that a sizable portion of the population rapidly approaching retirement lacks any type of pension coverage or an IRA in their own name; they will have to rely solely on Social Security and possibly other savings for their retirement income security. (The Freelancers Union reports that nearly two-thirds of their surveyed freelance workers-58%--save nothing for retirement.188) Lower-income older workers are especially likely to have inadequate resources when they retire. Our study’s results argue for broadened retirement plan coverage early in careers to ensure income supplements to Social Security benefits and other savings. Ways to enhance coverage could include universal availability of pension payroll deductions, reducing administrative costs for starting pension plans, and expanding 401(k) automatic enrollments. While increasing coverage is a necessary it is not a guarantee for attaining retirement income security. Ways of enhancing benefit amounts, e.g., reducing cash outs of lump sum distributions, should also be examined.189

In 1986, Charland said that retirement as we know it “is unlikely to outlast this century. Eventually the enterprise of helping individuals to reorganize their working lives in later years, rather than abandon them, will turn out to be in our national interest.” He cites a ‘third career’ phase after education (first) and full-time employment (second.)190

LIVING SPACE

4. Adapt the administration of rent laws to

---

189 Lichtenstein and Verma., 4.
In order to retain the intellectual and creative capital so central to the city, artists have long been acknowledged as economic drivers and part of the “glue” that holds neighborhoods together. Accessible and affordable housing for our creative populations when they are young will help insure the future vibrancy of New York City. Concepts like naturally recurring retirement communities (NORCs) should be made available to all ages to think about alternatives for their own future.

HEALTH CARE AND INSURANCE
5. Many policy makers agree that both the prohibitive costs and the difficulties in obtaining health care and insurance are national issues. Many baby boomers, conscious of both aging and preventive care, might lead the charge in this arena making sure that those most severely at risk—the children—have adequate health coverage before they become tomorrow’s aging population.

Almost all studies of artists confirm that over 80% have health insurance. While this is true, the barriers of high cost and accessibility apply not only to artists, but also to workers who are self-employed, unemployed and often working for non-profit institutions. Due to perceptions of their lifestyle, artists are also at times discriminated against, making obtaining insurance even more difficult. A series of alternative models for health insurance for artists in both the private and public sectors has been suggested by the Washington Health Project and Leveraging Investments in Creativity. These are potential models for health care protection, service and delivery in the greater national healthcare debate.

ESTATE TAXATION
6. By virtue of leaving their (usually) tangible work, artists have particular interest in being included in discussions about estate taxation.

Some have found ingenious solutions to preserve their art work. Others face the general dilemma of not knowing if their heirs will honor their wishes to take care of their art or, if no instructions are given, will honor the work itself. These situations might benefit individuals leaving other kinds of property to heirs.

SOCIAL SERVICES DELIVERY
7. Among the difficulties in delivering appropriate social services to older Americans are a lack of awareness of potential aid, lack of accessibility and outreach, inflexible regulations and the decentralization of services.

After conducting many town meetings with local communities about aging topics and the use of the study’s coupon referral system method, there is significant evidence of the substantial networks older artists have with each other. These networks

191 Prosper., 1-6.
might provide a basis for service delivery that reaches deeper into the community, thus increasing the access and impact of such services.

One solution for service delivery, whether through arts or social service agencies, is to tap into these networks and associated communities to enlist their help in getting the word out, educating each other and providing easier access. Artists (whether older or not) want to spend time doing their art work and anything in the service of making it easier to do that work may prove beneficial.

COMMUNITY

8. According to the RAND study Gifts of the Muse, people are drawn to the arts because they provide meaning and a “distinctive type of pleasure and emotional stimulation.” These intrinsic elements can lead not only to the development of individual capacities, but also to community cohesiveness that benefits the larger public.\(^\text{194}\)

These elements are evidenced by the creation of social bonds and the expression of communal meanings. Aging artists are an important part of the glue that give communities meaning.

While local economic growth has long been a rationale for support of the arts in a community, the communicative experience of the arts allows people to expand their capacities for empathy, tolerance and understanding and to acknowledge expressions of violence, trauma and discrimination in an appropriate sphere. They contribute to a liberal education, making for a more enlightened workforce.

LEGACY

9. Older artists’ contributions to the human community are as important as the results of their labor. They record our legacies in material ways for future generations and exemplify our national identity.

The honor afforded artists in some other cultures as the keepers of our collective legacy might serve as a model in the United States. As the lifespan increases so does the responsibility for understanding ourselves and our contexts. This is articulated by the United Nations’ International Plan of Action on Ageing:

A longer life provides humans with an opportunity to examine their lives in retrospect, to correct some of their mistakes, to get closer to the truth and to achieve a different understanding of the sense and value of their actions. This may well be the more important contribution of older people to the human community. Especially at this time, after the unprecedented changes that have affected humankind in their lifetime, the reinterpretation of life-stories by the aged should help us all to achieve the urgently needed reorientation of history.\(^\text{195}\)

ARTIST-SPECIFIC RECOMMENDATIONS

1. Reinvent the community of artists.

Artists made us aware that the community of artists should be broadened and that more opportunities should be created to reflect that expansion. They provided some interesting practical ideas to recreate a more communicative and integrated community:

- Create artists’ studios on Governor’s Island, where visitors would walk through the artists’ studios to get to cafes, restaurants, bookstores, etc.
- Create a new type of foundation offering storage space to artists.

• Make provision for artists’ studios which remain in gentrified areas.

• Recycle city buildings that artists can renovate and live in (the way SoHo began).

• Designate dedicated areas in new condo/co-op/apartment housing for a gallery run by artists.

• Provide access to workspace for established aging artists to make their work.

• Create more opportunities for artists to communicate with each other.

2. Create work/studio and exhibition space in government buildings.

Some artists suggested a variation on the city’s Percent-for-art program where aging artists’ work is featured.

3. Provide services for immigrant artists.

These include translation services to promote their work, and access to critics and scholars writing on contemporary art.

4. Give more government and other grant funds for aging artists and greater access to existing grant funds.

Many artists feel that they are being passed over for younger artists or simply not encouraged in the competition for funds and therefore, few apply. This might also mean some assistance needs to be provided for grant writing skills and application materials. Needs range from making larger works that small studios cannot accommodate to work for which artists need studio assistance.

5. Provide help to artists and increase their access to social and artistic services.

Translate or broaden successful existing artist services such as Creative Capital’s career management seminars, ArtHome’s Creative Money Workshops and self-assessment tools and find ways to take these to aging artists.

6. Provide services that assist in transporting and archiving work.

Aging artists are often incapable, both physically and monetarily, of transporting their own work to shows, competitions and storage facilities. There is also need for resources to help artists archive their work (as the Joan Mitchell Foundation is doing for a few artists), and create a “legacy plan.” Studio assistants, volunteers, students and services from non-profit organizations could be helpful here.

7. Integrate information about aging artists’ work and the process of career longevity into artist education.

With societal attention on youth and celebrity, the lessons of a long life of commitment, learning and problem-finding exemplified by aging artists should be included in the professional education of artists. The watchword for future policy comes from an artist in the study:

—79-year old female artist

“After you dissect artists, make sure you put them back together.”
—Well-known Black male painter, age 75, who died during the study
Bibliography

— 1998. Information on Artists II. New York, NY: Research Center for Arts and Culture Columbia University. This study looked at a variety of kinds of artists in New York City, Los Angeles, Minneapolis/ St. Paul and San Francisco.

Appendix A

DISTRIBUTION OF RESPONSES

Some Notes about the Data Portion of This Report

The data presented here are raw data. Please note that there are a number of questions whose data have not been reported here. Most of these are open-ended, write-in responses. In other cases, responses sum to over 100% due to multiple answers.

The data are presented for professional artists only; they are presented both in the aggregate and by gender. For those who might want to study a particular area in greater depth see www.cpanda.org.

If your relationship to your materials changed throughout the course of your work, how has it changed (all that apply)?

**a) It has not changed**

<table>
<thead>
<tr>
<th></th>
<th>Aggregate</th>
<th>Male</th>
<th>Female</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Valid %</td>
<td>18.4%</td>
<td>30.0%</td>
</tr>
<tr>
<td></td>
<td>Frequency</td>
<td>25</td>
<td>15</td>
</tr>
<tr>
<td>No</td>
<td>Valid %</td>
<td>81.6%</td>
<td>70.0%</td>
</tr>
<tr>
<td></td>
<td>Frequency</td>
<td>111</td>
<td>35</td>
</tr>
<tr>
<td>Missing</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Total # of Respondents who answered the question</td>
<td>Frequency</td>
<td>136</td>
<td>50</td>
</tr>
</tbody>
</table>

**b) I use different materials**

<table>
<thead>
<tr>
<th></th>
<th>Aggregate</th>
<th>Male</th>
<th>Female</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Valid %</td>
<td>51.8%</td>
<td>39.2%</td>
</tr>
<tr>
<td></td>
<td>Frequency</td>
<td>71</td>
<td>20</td>
</tr>
<tr>
<td>No</td>
<td>Valid %</td>
<td>48.2%</td>
<td>60.8%</td>
</tr>
<tr>
<td></td>
<td>Frequency</td>
<td>66</td>
<td>31</td>
</tr>
<tr>
<td>Missing</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Total # of Respondents who answered the question</td>
<td>Frequency</td>
<td>137</td>
<td>51</td>
</tr>
</tbody>
</table>

**c) I use a wider variety of materials**

<table>
<thead>
<tr>
<th></th>
<th>Aggregate</th>
<th>Male</th>
<th>Female</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Valid %</td>
<td>37.8%</td>
<td>40.8%</td>

ARTISTS’ PASS

THE RESEARCH CENTER FOR ARTS AND CULTURE

ARTISTS’ PASS
with compliments for your valued participation
in the Research Center’s pioneering study, Information on Artists III:
Special Focus Aging Artists in New York’s 5 Boroughs

Coupons Expire 10/31/2007. Artists’ Pass is only for artists with coupon numbers who participate
in IOA III Aging Visual Artists Study 62+

Dear Artist,

Thank you for participating in The Research Center for Arts and Culture’s pioneering study,
Information on Artists III: Special Focus Visual Artists age 62 and over in New York’s 5 Boroughs.
Our study will benefit greatly from your interview and efforts to hand out the referral coupons
to visual artists that you know. To use the discounts in the Artists’ Pass, simply tear out each
pass and present it to the retailer. To register for free services, seminars, or workshops, use the
contact information provided on each pass. I wish you all the best in your creative pursuits!

Sincerely,

Joan Jeffri, Director
